Leaning includes 50 well-thought-out projects designed for grades 3-5. In assigning your students projects that dig into Michigan's geography, history, government, economy, current events, and famous people, you will

deepen their appreciation and understanding of Michigan while simultaneously improving their analytical skills and ability to recognize patterns and big-picture themes. Project-based learning today is much different than the craft-heavy classroom activities popular in the past. Inquiry, planning, research, collaboration, and analysis are key components of project-based learning activities today. However, that doesn't mean creativity, individual expression, and fun are out. They definitely aren't! Each project is designed to help students gain important knowledge and skills that are derived from standards and key concepts at

the heart of academic subject areas. Students are asked to analyze and solve problems, to gather and interpret data, to develop and evaluate solutions, to support their answers with evidence, to think critically in a sustained way, and to use their newfound knowledge to formulate new questions worthy of exploring. While some projects are more complex and take longer than others, they all are set up in the same structure. Each begins with the central project-driving questions, proceeds through research and supportive questions, has the student choose a presentation option, and ends with a broader-view inquiry. Rubrics for reflection and assessments are included, too. This

consistent framework will make it easier for you assign projects and for your students to follow along and consistently meet expectations.

Encourage your students to take charge of their projects as much as possible. As a teacher, you can act as a facilitator and guide. The projects are structured such that students can often work through the process on their own or through cooperation with their classmates.

Matthew Johll's *Exploring Chemistry* overs the standard topics for the nonmajors course in the typical order, but each chapter unfolds in the context of a single case study that helps students connect what they are learning to real-life situations. For example, students work through the often-difficult topics of

molecular structure, gas laws, and organic chemistry by learning about the development of powerful new chemotherapy drugs, new technologies for screening airline passengers, and the creation of biodegradable biopolymers. It's the same case-driven approach that Johll uses in his acclaimed *Investigating Chemistry* (now in its Third Edition) but *Exploring Chemistry* goes beyond the other book's specific focus on examples from forensic science to use real-life stories from cooking, athletics, genetics, green chemistry, and more.

### Half-Life of a Zealot

Gallopade International Videogames are a unique artistic form, and to analyse and understand them an equally unique language is required. Cremin turns to Deleuze and Guattari's non-representational philosophy to develop a conceptual toolkit for thinking anew about videogames and our relationship to them. Rather than approach videogames through a language suited to other media forms, Cremin invites us to think in terms of a videogame plane and

the compositions of developers and players who bring them to life. According to Cremin, we are not simply playing videogames, we are creating them. We exceed our own bodily limitations by assembling forces with the elements they are made up of. The book develops a critical methodology that can explain what every videogame, irrespective of genre or technology, has in common and proceeds on this basis to analyse their differences. Drawing from a wide range of examples spanning the history of the medium, Cremin discerns the qualities inherent to those regarded as classics and what those qualities enable the player to do. Exploring Videogames with

Deleuze and Guattari analyses different aspects of the medium, including the social and cultural context in which videogames are played, to develop a nuanced perspective on gendered narratives, caricatures and glorifications of war. It considers the processes and relationships that have given rise to industrial giants, the spiralling costs of making videogames and the pressure this places developers under to produce standard variations of winning formulas. The book invites the reader to embark on a molecular journey through worlds neither 'virtual' nor 'real' exceeding image, analogy and metaphor. With clear explanations and detailed analysis, Cremin demonstrates

the value of a Deleuzian approach to the study of videogames, making it an accessible and valuable resource for students, scholars, developers and enthusiasts.

Half Lives Gallopade International

Although project management is a newly recognised profession, it deals with a number of significant challenges. We seem to operate in an unprecedented environment, rife with change, innovation and turbulence. Moreover, projects by their very nature tend to push boundaries, encourage novelty and demand engagement with the uncertain and the unknown. Indeed, projects reflect our organised impulse to constantly amend, shape, improve and refine our context. So how can future projects overcome the

challenges? Rethinking Project Management for a Dynamic and Digital World makes a powerful and original statement equipping project leaders and managers with new approaches and frameworks for an increasingly demanding world where the traditional methods, models and mindsets no longer suffice. The book explores new trends, promising ideas and novel concepts and distils the fundamentals for marshalling a world concerned with people, communities and value by deploying innovation, rethinking purpose and acting responsibly. An increasingly borderless, upwardly mobile and entrepreneurial society

requires a revamped and revitalised project perspective that is more dynamic, adaptive and reflective. This volume brings together some of the best writing by leading authorities on many key topics, including benchmarking, lean quality, communicating, teams and teamwork, followership, organising for project work, project frameworks, agile working, project portfolios, strategic initiatives, strategic alignment, trust, entrepreneurship, putting people first, social processes, positive organisations, rethinking progress, the hacker paradigm, community, stewardship and knowledge

management. The collection thus offers an invaluable new resource for informed managers looking to engage with the latest thinking and research and for researchers seeking to reflect on how the discipline is changing.

*Exploring Maryland Through Project-Based Learning* Vintage

First published in 1994. Leading scholars in science education from eight countries on four continents and expert practising science teachers (primary and secondary) wrote about the teaching and learning of particular science content or skills, and hence how different science content requires different sorts of teaching and learning. Having shared the papers, they then met

to discuss them and subsequently revised them. The result is a coherent set of chapters that share valuable insights about the teaching and learning of science.

Some chapters consider the detail of specific topics (e.g. floating and sinking, soil and chemical change), some describe innovative procedures, others provide powerful theory. Together they provide a comprehensive analysis of constructivist learning and teaching implications.
