This atlas, in which a wealth of illustrations are supported by clear explanatory text, offers an up-to-date and comprehensive overview of the immediate restoration of teeth and immediate functional loading when using different implant systems and surfaces in patients with single tooth loss or partial or complete edentulism. It provides guidance on all aspects of technique, including procedures for impression and measurement taking, and describes the surgical and prosthetic protocols applicable in various settings. The coverage encompasses the more advanced techniques used for immediate loading of implants placed in conjunction with grafting/augmentation procedures or in fresh extraction sockets, as well as immediate implant loading for mandibular and maxillary full-arch rehabilitation. This atlas will help dental students and practitioners to gain a sound understanding of immediate loading techniques, including their indications and limitations, and to apply them optimally in their practice. The atlas also shows and explains how to integrate a full digital workflow from the intraoral scanner to solve complex cases in a simple way.

Zöller Bone and Soft Tissue Augmentation in Implantology addresses useful methods of bone grafting procedures in implant treatment based on current biologic principles and constitutes a unique reference in this field. The information presented includes not only the underlying scientific concepts of the different augmentation techniques with autogenous bone, but also the associated soft tissue management, from safe approaches to different possibilities for soft tissue augmentation and papilla reconstruction techniques. The book provides surgeons with a basic understanding of the biologic response to bone grafting procedures. Experienced implantologists will benefit from the in-depth background information, details of high-level surgical techniques, and scientific results, which will enable them to optimize their surgical procedures. Each chapter offers a wealth of information on the specific topic covered, with much attention given to the scientific concepts behind each one. Extensive case reports with step-by-step documentation allow readers to gain an impression of what is possible today in the 3D reconstruction procedures of the alveolar crest. Important criteria for success are presented as well as possible complications and their treatment. Bone and Soft Tissue Augmentation in Implantology is a must-read for every implantologist, oral and maxillofacial surgeon, and any dentist interested in surgery.

Failure of eruption of permanent teeth (tooth impaction) represents a common, but as yet largely unexplored, problem with regard to proper treatment and prevention. This condition

affects almost 20% of the population. Thus, the third molar impaction problem alone represents the second most expensive medico-dental surgical problem in the United States. Apart from that, the sequelae of surgical removal of third molars (that is, dental nerve damage) are the most frequent complaints in dental litigation in the United States. This book includes manifold aspects of tooth impactions such as etiology, diagnosis, treatment and prevention of all types of tooth impactions. The treatment aspect is illustrated by step-by-step color illustrations of all aspects of the surgical procedure.
