This latest book in the bestselling '50 Ideas' series is a wonderfully accessible overview of the only place we know of in the universe that is capable of sustaining life. Expert popular science writer Martin Redfern covers all the natural processes of the Earth: climate, ocean currents, air currents, the elements, plate tectonics, fossils, the evolution of life, volcanology, sea levels and the ultimate fate of the Earth. The 50 Ideas featured include: Geological formation; Rock layers; Formation of the atmosphere; Plate tectonics; Continental rifts; Volcanology; Simple life; Multi-cellular life; Snowball Earth; Gondwana and Pangea; Sexual selection; Complex life; The Cambrian revolution; The dinosaurs; Avalonia; The sauropod puzzle; End of the Mesozoic; The Cenozoic recovery; The Great Warming; The 'Great Flood'; The Holocene; Biodiversity and The fate of the Earth.

Stone monuments and objects are highly accessible today and formed a focus for engagement, transformation and re-use in the past. Stone is inextricably linked to ideas of monumentality and remembrance. It formed an active medium in the creation of identities and memory in a range of social contexts and practices, including the embodied, performative and incorporated practices of daily activities and traditions. It can be argued that the material presence and physical character of stone objects and monuments were not only actively harnessed in these encounters, but were also the very stuff from which social relations were derived, perceived and thought through. This volume explores the power and effect of stone through the meanings that emerged out of peoples engagement and encounters with its physical properties. Focused primarily on the Neolithic and Bronze Age of Atlantic Europe it brings together authors working on the materiality (materialitas) of stone via stone objects, rock art, monuments and quarrying activity. This highlights the connections that cross-cut what are traditionally seen as disparate research areas within the archaeological discipline.

¿Quiere saber qué le deparan el 2017 y el 2018? Este libro contiene las previsiones llevadas a cabo por Francesca Garro y Chiara Bertrand, a través de las cuales podrá descubrir las grandes líneas de su destino en todos los terrenos (vida sentimental, profesión, dinero, salud...). Además, se incluye un capítulo en el que podrá conocer el nombre de personajes famosos con su mismo signo del zodiaco. Esta obra, indispensable para todos los aficionados a la astrología, le explicará las características generales de Escorpio, la influencia de los planetas en su personalidad, el papel de las casas y del ascendente. Encontrará, asimismo, valiosas indicaciones sobre el modo de construir una ficha astrológica personal, las profesiones que más le convienen y sus relaciones con los demás signos.

La defensa de la bahía de Matanzas, en el occidente de Cuba, constituyó uno de los proyectos fundamentales para proteger las cercanías de La Habana y la nueva población fundada en 1693. Para ello se iniciaron las obras del Castillo de San Severino, inmueble que inauguró los disímiles proyectos para la fortificación de la rada. Para ello se construyeron las baterías de La Vigía, El Morrillo, Peñas Altas y Los Prácticos, además de un torreón. A partir de la planimetría y otros documentos históricos procedentes de archivos cubanos y españoles, se construye una nueva narrativa que contribuye a conocer la historia de estos baluartes que jugaron un rol significativo en el desarrollo regional. Su conocimiento aporta a la necesaria conservación de las fortificaciones matanceras como patrimonio de todos.

The Archaeology of the Caribbean is a comprehensive synthesis of Caribbean prehistory from the earliest settlement by humans more than 4000 years BC, to the time of European conquest of the islands, from the fifteenth through seventeenth centuries. Samuel Wilson reviews the evidence for migration and cultural change throughout the archipelago, dealing in particular with periods of cultural interaction when groups with different cultures and histories were in contact.

This book provides an up-to-date compilation of the latest research on the petrography, facies, paleoenvironmental significance and economic aspects of continental carbonates. The overall organization of the book first emphasizes the descriptive aspects and processes operating on carbonate deposits in greatly varied settings, and then considers applications for basin analysis, as well as economic and historical aspects. This volume will be a valuable tool for graduate and postgraduate students as well as for experienced researchers. The second part (volume 62 in this series) will deal with the geochemistry, diagenesis and applications of carbonates in continental settings. Covering the greatly varied aspects of carbonate deposits from continental settings deposits Clear and easy to follow organization Up to date information, so readers can find references from the classic

Palaeomagnetism in Fold and Thrust Belts: New Perspectives John Wiley & Sons

This book will suggest new agendas for identity and heritage studies by means of presenting contentious issues facing archaeology and heritage management in a globalized world. The book is not only present the variability of heritage objectives and experiences in the New and Old World, and opens a discussion, in a shrinking world, to look beyond national and regional contexts. If the heritage sector and archaeology are to remain relevant in our contemporary world and the near future, there are a number of questions concerning the politics, practices and narratives related to heritage and identity that must be addressed. Questions of relevance in an affluent, cosmopolitan setting are at odds with those relevant for a region emerging from civil war or ethnic strife, or a national minority battling oppression or ethnic cleansing. A premise is that heritage represents a broad scope of empirically and theoretically sound interpretations – that heritage is a response to contemporary forces, as much as data. It is therefore necessary constantly to evaluate what is scientifically accurate as well as what is valid and relevant and what can have a contemporary impact.

Calcretes are an important component of many ancient fluvial, lacustrine and shallow-marine carbonate sequences, and they are widely developed in many parts of the world at the present time. Calcretes are useful to the earth scientist involved in reconstructing ancient environments, palaeoclimates and palaeographics, and they may also reveal details of soil biota and chemistry. Over the last two decades the journal Sedimentology has published a number of articles on this subject and a compilation of them is presented here. In addition to the five main sections, this volume also includes an introduction to the subject that offers a review of recent work on calcretes. The collection of papers illustrates the range of calcrete occurrences and the great variety of textures and fabrics. This volume is authored and edited by experts and will serve as more than an introduction to the subject for geologists, soil scientists and geographers. If you are a member of the International Association of Sedimentologists, for purchasing details, please see: <http://www.iasnet.org/publications/details.asp?code=RP2>

From measuring geological time, through unravelling the evolution of continents, ocean and mantle, to understanding climate change, modern geochemistry is a discipline which pervades nearly all of the Earth Sciences. Geochemistry provides a broad introduction to the subject, which concentrates on the inorganic chemistry of the condensed part of our planet. This new textbook is written by the author of the authoritative and widely acclaimed Introduction to Geochemical Modelling (Cambridge, 1995). Emphasizing general principles rather than specific observations, Professor Albarède leads the reader through the simplest concepts of physics and chemistry behind geochemical processes. He covers fields central to geochemistry, such as crystal chemistry, mass balance and element transport, and geochemical dynamics. A broad range of applications is introduced, in natural water systems, the deep Earth and planetary processes. Geochemistry is an ideal textbook for undergraduate students, and will also provide an accessible introduction for researchers working in related fields.

The Archaeology of Colonialism demonstrates how artifacts are not only the residue of social interaction but also instrumental in shaping identities and communities. Claire Lyons and John Papadopoulos summarize the complex issues addressed by this collection of essays. Four case studies illustrate the use of archaeological artifacts to reconstruct social structures. They include ceramic objects from Mesopotamian colonists in fourth-millennium Anatolia; the Greek influence on early Iberian sculpture and language; the influence of architecture on the West African coast; and settlements across Punic Sardinia that indicate the blending of cultures. The remaining essays look at the roles myth, ritual, and religion played in forming colonial identities. In particular, they discuss the cultural middle ground established among Greeks and Etruscans; clothing as an instrument of European colonialism in nineteenth-century Oceania; sixteenth-century Andean urban planning and kinship relations; and the Dutch East India Company settlement at the Cape of Good Hope.

The geology of Northern Haiti corresponds to a volcanic arc of Meso-Cenozoic Age that can be traced from Central Cuba, through the Dominican Republic and forms part of the mountains of the Massif du Nord group oriented NW-SE. This group is composed mainly by volcanic tuffs and lavas from the volcanic belt, ranging in composition from felsic, through intermediate, to mafic and ultramafic rocks. The belt is composed of numerous lenticular bodies of lavas and pyroclastic material of felsic composition, varying from dacite to rhyolite, embedded in a thick series of predominant

mafic volcanoclastic rocks, mainly andesite with lesser amounts of basalts, with numerous intercalations of diverse sedimentary rocks, like radiolarians cherts, carbonate rocks, and tuffs. Copper and gold are the two main ore types in the area. Copper is usually found associated with the porphyritic facies, the apophyses microtonalitics, and the silicified zones, filling fissures and fractures, as well as disseminated. Within the quartz vein systems, the copper is contained in the chalcopyrite, while the gold appears both as native gold and as a very fine disseminated gold in the sulphide zone. It can also form spectacular concentrations on the oxidised cap.

Palaeomagnetism is a technique used to understand complex deformation patterns in fold-and-thrust belts; it can be used to characterize the distribution, magnitude and timing of vertical axis rotations, an elusive variable using other methods. A combination of palaeomagnetic and structural geology analyses has helped to unravel the geometry and kinematics of fold-and-thrust belts around the world and of different geological ages for more than 50 years. This volume comprises three sections: the first shows thorough overviews of western Mediterranean arcs and the western Carpathians; the second depicts several examples from the Andes, the Alps, Anatolia, Pyrenees, Iberian Ranges and the Atlas; and the third shows the latest research on the use of palaeomagnetism to understand fold-and-thrust belts in 3D and 4D in a more quantitative way and it also includes some methodological proposals to avoid common errors. In the papers of the first two sections, the combination of palaeomagnetic analyses with structural data, AMS or magnetostratigraphic analyses demonstrate the usefulness of palaeomagnetism in deciphering complex deformation patterns in fold-and-thrust belts.

Se exploran las posibilidades de colaboración interdisciplinarias entre la arqueología, la espeleología y la geología. Se introducen metodologías de estudio, técnicas analíticas geoquímicas y términos básicos para la identificación de minerales. Este trabajo está orientado, fundamentalmente, a los arqueólogos y espeleólogos aficionados.

Si desea conocer con todo detalle los rasgos que definen la personalidad y el carácter de su signo, Silvia Heredia de Velázquez le proporciona en este

libro toda la información que necesita. ¿Y qué hay de la relación con los otros signos del zodiaco y la influencia del ascendente? Todos estos aspectos son tratados aquí en profundidad; además, se explica cómo realizar el cálculo para que cada uno pueda averiguar cuál es su ascendente. En el apartado de previsiones para 2019 podrá ver lo que le depara el futuro este año en los temas que son de mayor interés para todo el mundo (salud, amor, vida laboral y vida familiar), y podrá comprobar la fiabilidad de las previsiones de esta astróloga y su bien merecido prestigio.

This volume presents a collection of articles which offer different perspectives for archaeological pottery studies, regarding the understanding of pre-Hispanic social practices in Quebrada de Humahuaca, Argentina. The aim of this volume is to contribute to Quebrada de Humahuaca archaeological knowledge and its inclusion in current discussions about Andean and worldwide history of pottery production. In 2003, Quebrada de Humahuaca was made a UNESCO World Heritage Site. Numerous tracks, roads and settlements testify to its pre-Hispanic and post pre-Hispanic history from pre-ceramic to colonial times. Due to its strategic position Quebrada de Humahuaca has been colonized by both the Inca and the Spaniards. It also has been a stage for many battles of the Argentine War of Independence. The richness and abundance of ceramic material evidence in the landscape of the Quebrada de Humahuaca has provided archaeologists information about human behaviour and social practices both in every and ritual activities. Quebrada de Humahuaca, in the province of Jujuy (the northernmost sector of Argentina) is one of the most widely recognized archaeological zones and one of the most widely studied. Through extensive excavations of the most conspicuous settlements, archaeologists managed to characterize these pre-Hispanic agricultural societies and construct chronologies of northwestern Argentina, and to elaborate models of trans-Andean population dynamics.
