**Get Through MCEM Part A: MCQs** McGraw Hill Professional  
Diagnosis and Treatment in Internal Medicine equips trainee doctors with the essential skills and core knowledge to establish a diagnosis reliably and quickly, before outlining the management of the clinical condition diagnosed. Organised into three sections, the first provides a vital overview, whilst the second focuses on common presentations and diagnoses. Uniquely, this new book shows readers how to turn symptoms into a list of diagnoses ordered by probability - a differential diagnosis. Experienced consultants who teach trainees every day demonstrate how to derive an ordered differential diagnosis, how to narrow this down to a single diagnosis and if not, how to live with diagnostic uncertainty. The final section provides a comprehensive account of the management of system-based syndromes and diseases. Highly-structured chapters emphasize how common conditions present, how to approach a diagnosis, and how to estimate prognosis, treatment and its effectiveness. An onus is placed on the development of crucial diagnostic skills and the ability to devise evidence-based management plans quickly and accurately, making this an ideal text for core medical trainees.

In recent years, Bayes and empirical Bayes (EB) methods have continued to increase in popularity and impact. Building on the first edition of their popular text, Carlin and Louis introduce these methods, demonstrate their usefulness in challenging applied settings, and show how they can be implemented using modern Markov chain Monte Carlo (MCMC) methods. Their presentation is accessible to those new to Bayes and empirical Bayes methods, while providing in-depth coverage valuable to seasoned practitioners. With its broad appeal as a text for those in biomedical science, education, social science, agriculture, and engineering, this second edition offers a relatively gentle and comprehensive introduction for students and practitioners already familiar with more traditional frequentist statistical methods. Focusing on practical tools for data analysis, the book shows how properly structured Bayes and EB procedures typically have good frequentist and Bayesian performance, both in theory and in practice.

The United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) assesses the levels and effects of exposure to ionizing radiation. UNSCEAR's scientific findings underpin radiation risk evaluation and international protection standards. This report comprises a report to the General Assembly with two underpinning scientific annexes. The first annex recapitulates and

clarifies the philosophy of science as well as the scientific knowledge for attributing observed health effects in individuals and populations to radiation exposure, and distinguishes between that and inferring risk to individuals and populations from an exposure. The second annex reviews the latest thinking and approaches to quantifying the uncertainties in assessments of risk from radiation exposure, and illustrates these approaches with application to examples that are highly pertinent to radiation protection. The report is a landmark publication in terms of our understanding of the confidence that can be attached to the attribution of health effects in individuals and populations, and to the estimation of risks inferred from exposure to ionizing radiation.

**Palaeopathology of Children: Identification of Pathological Conditions in the Human Skeletal Remains of Non-Adults** provides archaeological examples of pathological child remains with varying degrees of disease manifestation, and where possible, presents illustrations of individually affected bones to help with identification. The structure and inclusion of photographs and summary diagnostic tables make this suitable for use as a textbook. Each chapter includes a table of international archaeological cases collated by the author from published and unpublished literature. Child skeletal remains come in a variety of different sizes, with bones appearing and fusing at different times during growth. Identifying pathology in such unfamiliar bones can be a challenge, and we often rely on photographs of clinical radiographs or intact anatomical specimens to try and interpret the lesions we see in archaeological material. These are usually the most extreme examples of the disease, and do not account for the wide degree of variation we may see in skeletal remains. Provides a comprehensive review of the types of pathological conditions identified in non-adult skeletal remains Contains chapters that tackle a particular disease classification Features for each condition are described and illustrated to aid in the identification
