STAAR Math Exercise Book for Grade 5 Carson-Dellosa Publishing

"The present almost universal employment of standard tests, in the public schools, has made it essential that there should be available for teachers a brief and simple statement of those few elements of statistical method which it is necessary for a teacher to know, if the best use is to be made of the results of the testing. The books on statistics at present available are, for the most part, too elaborate and technical for the needs of the busy teacher. They present many special methods which are rarely if ever used by her, and they usually omit explanation of certain elementary procedures about which some discussion is necessary for those who are attempting to acquaint themselves with statistical methods without the aid of an instructor. It is for such teachers in service that these lessons are especially intended; they enable a teacher to instruct herself in the few essential statistical procedures which every teacher should know. The lessons have also been found very valuable, however, in first courses dealing with mental and educational tests. Methods of tabulating, using norms, and graphing can be really learned only by using them; the chapter on statistical methods in the usual book on tests is of necessity inadequate. These practice exercises will actually establish these skills. It is believed, in short, that for both the teacher who is instructing herself and for the student in a beginning course on tests these lessons will prove of decided helpfulness"--Book. This study is focused on a two-year comparison of 5th grade standardized reading test scores. The goal was to find if differences exist after one elementary school switches its reading instruction from basal texts and implements a balanced reading approach delivered through the Reading Workshop model. The implementation school's scores were examined in a before and after analysis and compared to demographically similar elementary schools. Another point of interest in this study was to find where the differences exist with respect to ethnic and socioeconomic categories. The data collected was all public and published by the Minnesota Department of Education and subjected to a secondary analysis. The

results of this study suggest a correlation exists between the implementation of a balanced reading approach and improvement in standardized reading test scores.

Growing concerns over the achievement of U.S. students have led to proposals to reward good teachers and penalize (or fire) bad ones. The leading method for assessing teacher quality is "value added" modeling (VAM), which decomposes students' test scores into components attributed to student heterogeneity and to teacher quality. Implicit in the VAM approach are strong assumptions about the nature of the educational production function and the assignment of students to classrooms. In this paper, I develop falsification tests for three widely used VAM specifications, based on the idea that future teachers cannot influence students' past achievement. In data from North Carolina, each of the VAMs' exclusion restrictions are dramatically violated. In particular, these models indicate large "effects" of 5th grade teachers on 4th grade test score gains. I also find that conventional measures of individual teachers' value added fade out very quickly and are at best weakly related to long-run effects.

Correlation Between 5th Grade End-of-year Math Grades and Abacus Test Scores for the 2004-2005 School Year

The Indiana Statewide Testing for Educational Progress-Plus (ISTEP+) was designed to assess student mastery of key educational goals. The 5th grade ISTEP+ Science Test (5-GIST) is part of the ISTEP+ testing regime. Since its inception, the purpose of the tests has shifted from assessment of individual student academic progress to evaluation of the quality of the educational institution administering the tests. The validity of this use has never been established. This study assesses the validity of the 5-GIST as an instrument for assessing and forming judgments about the quality of science instruction in a particular school. ISTEP+ scores of 2 cohorts of students in a Midwestern school district were converted into Z-scores and tracked from 3rd to 5th grade. A regression line was established to account for the general aptitude and the socio-economic status (SES) of the students. The residuals of the 5-GIST scores revealed that between 57% and 60% of the variance in the scores can be attributed to the general aptitude and SES of the students. Thus, the quality of teaching can have, at best, a secondary impact on the test scores.
