Neither legalization of abortion nor scientific and political advances in contraception and abortion ensure that training and research in family planning are routinely integrated into medical education. Without integration, subsequent generations of healthcare professionals are not prepared to incorporate evidence-based family planning into their practices, teaching, or research. Omission of this crucial component prevents the cultural and professional normalization of an often stigmatized and embattled aspect of women's health. Taking the successful US-based Ryan and Family Planning Fellowship programs as templates for training, teaching, and academic leadership, this book describes the

integration of family planning and pregnancy termination into curricula with an international outlook. With an evidence- and systems-based approach, the book is a unique and practical guide to inspire and train the next generation of healthcare professionals.

Information technology and the information sciences have been part of our lives for some time now. They have revolutionized the healthcare system, changing the whole health landscape, as well as health culture. New devices, sources of data and roles for all those involved in healthcare are being developed as a result. This book presents the proceedings of the 25th European Medical Informatics

Conference, held in Istanbul, Turkey in August/September 2014. The conference aims to present the most recent developments in biomedical informatics. The book is divided into 15 sections, which include: decision support systems and clinical practice guidelines; improved healthcare through informatics; data analysis; mobile health; technology and system evaluation; and text mining. The final two sections present posters from the conference. The book will be of interest to all those in the healthcare sector, researchers and practitioners alike, who develop, evaluate or work with information technology.

Survey sampling is fundamentally an applied field. The goal in this book is to put an array of tools at the fingertips of practitioners by explaining approaches long used by survey statisticians, illustrating how existing software can be used to solve survey problems, and

developing some specialized software where needed. This book serves at least three audiences: (1) Students seeking a more in-depth understanding of applied sampling either through a second semester-long course or by way of a supplementary reference; (2) Survey statisticians searching for practical guidance on how to apply concepts learned in theoretical or applied sampling courses; and (3) Social scientists and other survey practitioners who desire insight into the statistical thinking and steps taken to design, select, and weight random survey samples. Several survey data sets are used to illustrate how to design samples, to make estimates from complex surveys for use in optimizing the sample allocation, and to calculate weights.

Realistic survey projects are used to demonstrate the challenges and provide a context for the solutions. The book covers several topics that either are not included or are dealt with in a limited way in other texts. These areas include: sample size computations for multistage designs; power calculations related to surveys; mathematical programming for sample allocation in a multi-criteria optimization setting; nuts and bolts of area probability sampling; multiphase designs; quality control of survey operations; and statistical software for survey sampling and estimation. An associated R package, PracTools, contains a number of specialized functions for sample size and other calculations. The data sets used in the book are also available in PracTools, so

that the reader may replicate the examples or perform further analyses. Now in its Sixth Edition, this foremost leadership and management text incorporates application with theory and emphasizes critical thinking, problem solving, and decision making. More than 225 case studies and learning exercises promote critical thinking and interactive discussion. Case studies cover a variety of settings, including acute care,

ambulatory care, long-term care, and community health. The book addresses timely issues such as leadership development, staffing, delegation, ethics and law, organizational, political, and personal power, management and technology, and more. Web links and learning exercises appear in each chapter. An Instructor's CD-ROM includes a testbank and PowerPoint slides.

The MANPOWER MANAGEMENT SYSTEM Task seeks to integrate the growing body of psychological, mathematical, and computer technology in the solution of manpower management problems. Under Task research objectives a specific requirement was generated for the development of rotation policy

models for use in evaluating alternative manpower policies for the inventory, allocation, and assignment of U.S. Army personnel in current and future systems. Eight manpower flow models, presented in this report, were developed to represent the Army personnel system under varying requirements and levels of complexity with respect to type of duty tour, flow of personnel, duration of tours, allocation of personnel, and alternation policy. Sample nomograms, facilitating estimation of effects of selected policy alternatives, are provided. Additional nomograms, based on models in the series, are presented in AD-640 005. In addition to the sample charts, a set of symbols is provided in a glossary which the user may apply in working with a specific problem selected for study.

Computer programs for estimating CONUS tour lengths have been written for two of the steady-state system models described in this report. A dynamic model has also been developed, using a computer simulation to represent the system during periods of transition. This model and its application will be described in a later publication. Detection of Pathogens in Water Using Micro and Nano-Technology aims to promote the uptake of innovative micro and nano-technological approaches towards the development of an integrated, cost-effective nano-biological

sensor useful for security and environmental assays. The book describes the concerted efforts of a large European research project and the achievements of additional leading research groups. The reported knowledge and expertise should support in the innovation and integration of often separated unitary processes. Sampling, cell lysis and DNA/RNA extraction, DNA hybridisation detection micro- and nanosensors, microfluidics, together also with computational modelling and risk assessment can be integrated in the framework of the current and evolving European regulations and needs. The development and uptake of molecular methods is revolutionizing the field of waterborne pathogens detection, commonly performed with time-

consuming cultural methods. The molecular detection methods are enabling the development of integrated instruments based on biosensor that will ultimately automate the full pathway of the microbiological analysis of water.

Job rotation denotes employees' lateral transfers between jobs within the same firm (Campion et al., 1994). This study is the first that tests empirically Ortega's (2001) employer learning argument, i.e., the employer learns about the employee if the latter rotates jobs. Consistent with his theoretical model findings, I document that job rotation is adopted if

the firm is uncertain about employees' job-specific human capital (e.g., employees' job-specific ability) or job-specific nonhuman capital (e.g., the applied technology) or if employees' job performance is influenced by an exogenous shock. For my analysis, I choose a comprehensive employee-based sample containing 26,957 observations from 35 European countries provided by the Fourth and Fifth European Working Conditions Survey in 2005 and 2010, respectively. The observations include all possible occupations, ranks, and industries. These findings are robust if incentives are estimated simultaneously.

It is widely known that microorganisms such as E. coli, Giardia and Cryptosporidium can enter streams during rain and snowmelt events. It is difficult to accurately determine the magnitude and timing of transport during such events, and identifying the sources of these contaminants. Reports the results of a study where microbial and water-quality measurements were collected during storm events under a variety of meteorological and land use conditions.
