A World Fit for  
Children  
Springer  
This second  
and expanded

edition of the  
first book on  
agromining  
(phytomining)  
presents a  
comprehensiv

e overview of the metal farming & recovery of the agromining production chain.

Agromining is an emerging technology that aims to transform the extraction of sources of target elements not accessible by traditional mining and processing techniques. Agromining, which is based on sustainable development, uses hyperaccumulator plants as 'metal crops' farmed on sub-economic

soils or minerals wastes to obtain valuable target elements. This volume is edited and authored by the pioneers in the rapidly expanding field of agromining and presents the latest insights and developments in the field. This book provides in-depth information on the global distribution and ecology of hyperaccumulator plants, their biogeochemical pathways,

the influence of rhizosphere microbes, the physiology and molecular biology of hyperaccumulation, as well as aspects of propagation and conservation of these unusual plants. It describes the agronomy of metal crops and opportunities for incorporating agromining into rehabilitation and mine closure, including test cases for agromining of nickel, cobalt, manganese,

arsenic, selenium, cadmium, zinc, thallium, rare earth elements and platinum group elements. Since the first edition was published, there have been successful nickel agromining field trials in the tropics (in Malaysia and Guatemala), and these are presented in a dedicated case study chapter. Other new chapters focus on the processing of bio-ore for elements other than nickel, such as

rare earth elements and cadmium, and on agromining from industrial wastes such as tailings, and industrial by-products and sites. Furthermore, the book features two new chapters that provide a comprehensive assessment of accumulation of a very wide range of elements from the Periodic Table in various plant species around the globe, and a chapter on practical methods for discovery of

hyperaccumulator plant species in the field and in the herbarium. This book is of interest to environmental professionals in the minerals industry, government regulators, and academics. The Innovative University Springer Science & Business Media Walking through social development's key theoretical principles and practice strategies, this book

shows how it promotes peoples' wellbeing not only in the Global South, where it first emerged, but in the Western countries as well. It covers: Definitions and an historical evolution of social development Key theoretical debates around social well-being, human rights and social justice Social development practice such as human capital interventions, community development

and cooperatives, asset building, employment creation policies and programmes, microenterprises and social planning among others Future challenges; global poverty, international aid and trade, and global inequality, conflict and injustice. Complete with international examples drawn from around the world, Social Development: Theory and Practice demonstrates how social

development theory translates into practical application. This book is essential reading for students in development studies, social policy, public administration and social work, and for policymakers and development practitioners everywhere. Their demands are simple: deliver one million</p>	<p>dollars, or the hostages will be killed one by one. Fast-paced and intensely psychological, this novel tells the story from the point of view of each of the hijackers—revealing each man’s motivations, desperations, and fatal flaws. with high quality, high efficiency, high flexibility, high resolution, versatility and low environmental load. Macro-processing based on thermal process using infrared lasers such as CO<sub>2</sub> lasers has been the mainstream in the early stages, while research and development of micro- and nano-processing are becoming increasingly more active as short wavelength and/or short

pulse width lasers have been developed. In particular, recent advances in ultrafast lasers have opened up a new avenue to laser material processing due to the capabilities of ultrahigh precision micro- and nanofabrication of diverse materials. This handbook is the first book covering the basics, the state-of-the-art and important applications of the dynamic and rapidly expanding

discipline of laser micro- and nanoengineering. This comprehensive source makes readers familiar with a broad spectrum of approaches to solve all relevant problems in science and technology. This handbook is the ultimate desk reference for all people working in the field. [Handbook of Laser Micro- and Nano-Engineering](#) Springer This study attempts to assess the

effect of HIV and AIDS on society from a socio-economic and political perspective.

In October 1982, a small international symposium was held at the Gesellschaft fUr Strahlen- und Umweltforschung mbH (GSF) in Munich as a satellite meeting of the IX International Conference on Analytical Cytology. The symposium focussed on

cytometric approaches to biological dosimetry, and was, to the best of our knowledge, the first meeting on this subject ever held. There was strong encouragement from the 75 attendees and from others to publish a proceedings of the symposium. Hence this book, containing 30 of the 36 presentations, has been assembled. Dosimetry, the accurate and systematic determination

of doses, usually refers to grams of substance administered or rads of ionization or some such measure of exposure of a patient, a victim or an experimental system. The term also can be used to describe the quantity of an ultimate, active agent as delivered to the appropriate target material within a biological system. Thus, for mutagens, one can speak of DNA dosimetry,

meaning the number of adducts produced in the DNA of target cells such as bone-marrow stem cells or spermatogonia.

This book concisely reviews important advances in radiation oncology, providing practicing radiation oncologists with a fundamental understanding of each topic and an

appreciation of its significance for the future of radiation oncology. It explores in detail the impact of newer imaging modalities, such as multiparametric magnetic resonance imaging (MRI) and positron emission tomography (PET) using fluorodeoxyglucose (FDG) and other novel agents, which deliver improved visualization of the physiologic and phenotypic

features of a given cancer, helping oncologists to provide more targeted radiotherapy and assess the response. Due consideration is also given to how advanced technologies for radiation therapy delivery have created new treatment options for patients with localized and metastatic disease, highlighting the increasingly important role of image-guided radiotherapy

in treating systemic and oligometastatic disease. Further topics include the potential value of radiotherapy in enhancing immunotherapy thanks to the broader immune-stimulatory effects, how cancer stem cells and the tumor microenvironment influence response, and the application of mathematical and systems biology methods to radiotherapy.

Divided into three parts, this resource first expands on the origin and implementation of the Emerging Researcher Program (ERP), complemented by critical reflections of the program's first four years. The second and third parts examine the seminar and supervision training programs that constitute core ERP business. These latter selections are based on

material developed for and presented at seminars and workshops. Participants in the ERP will gain insight into many program details and understand it as an adaptable model to address many situations both within South Africa and in the broader African context.

Brian Cuban was living a lie. With a famous last

name and a successful career as a lawyer, Brian was able to hide his clinical depression and alcohol and cocaine addictions—for a while. Today, as an inspirational speaker in long-term recovery, Brian looks back on his journey with honesty, compassion, and even humor as he reflects both on what he has learned about himself and his career choice and how the legal profession

enables addiction. His demons, which date to his childhood, controlled him through failed marriages and stays in a psychiatric facility, until they brought him to the brink of suicide. That was his wake-up call. This is his story. Brian also takes an in-depth look at why there is such a high percentage of problematic alcohol use and other mental health issues in the legal profession. What types of

therapies work? Are 12-step programs the only answer? Brian also includes interviews with experts on the subject as well as others in the profession who are now in recovery. The Addicted Lawyer is both a serious study of addiction and a compelling story of redemption.

award-winning CEO of a large international bank, Mizinga Melu knows what it's like being the only woman in the boardroom. It's not an easy ride. From navigating untaught corporate politics, finding her skills and experience routinely questioned, and having to work harder just to have her voice heard, her resilience has been constantly put to the test. However, she was primed to

overcome hardship. This isn't just a book about braving the odds in the boardroom-it's about how an ordinary girl from Zambia overcame such setbacks as the loss of her mother while still a young girl, failing out of nursing school as a young woman, and being denied an executive role she knew she was the most qualified for as an aspiring banker. Melu warmly invites readers into her world, chronicling

the experiences that have shaped her-from her childhood growing up on a farm and the growth of her deep and unwavering faith, to her years as a global banking executive balancing the demands of career and motherhood while living internationally . The Chronicles of Riddick Springer Nature An unfortunate by-product of industrialization is the contamination

of soil and water resources with toxic metals, which becomes an environmental concern when the concentration in soils begins to affect human health. Current remediation methods applicable to contaminated soils are expensive and environmentally invasive since they are based primarily on civil-engineering techniques. This book represents an overview of efforts in

exploiting biological and chemical processes to reduce the inherent risk associated with metal-contaminated soils. It presents a comprehensive, up-to-date analysis of in situ immobilization and inactivation of toxic metals by means of plants, microorganisms and invertebrates. Training in Paediatrics Del Rey Historically, the scientific method has been said to require

proposing a theory, making a prediction of something not already known, testing the prediction, and giving up the theory (or substantially changing it) if it fails the test. A theory that leads to several successful predictions is more likely to be accepted than one that only explains what is already known but not understood. This process is widely treated as the conventional method of achieving

scientific progress, and was used throughout the twentieth century as the standard route to discovery and experimentation. But does science really work this way? In *Making 20th Century Science*, Stephen G. Brush discusses this question, as it relates to the development of science throughout the last century. Answering this question requires both a philosophically and

historically scientific approach, and Brush blends the two in order to take a close look at how scientific methodology has developed. Several cases from the history of modern physical and biological science are examined, including Mendeleev's Periodic Law, Kekule's structure for benzene, the light-quantum hypothesis, quantum mechanics, chromosome theory, and natural

<p>selection. In general it is found that theories are accepted for a combination of successful predictions and better explanations of old facts. Making 20th Century Science is a large-scale historical look at the implementation of the scientific method, and how scientific theories come to be accepted. <i>Making 20th Century Science</i> Independently Published South Africa has the</p>	<p>world's largest number of people living with HIV. Nuclear Oncology describes the use of radionuclides in the diagnosis and management of malignant tumors. Both in vivo and in vitro techniques are included. The book was written by an international panel of authors, most, if not all, of whom are the pioneers of the techniques described. Their chapters reflect the universal views in the field of nuclear medicine and

oncology. Clinical aspects and technical details are presented for both standard and new nuclear oncological techniques, including breast scintigraphy, receptor imaging, monoclonal antibodies and positron emission tomography. This information will therefore be helpful to those dealing with the diagnosis and therapy of cancer using radionuclides, including

medical oncologists, radiation oncologists, oncologic surgeons, nuclear medicine physicians and radiologists. Attention is devoted to potential areas of clinical research in nuclear oncology. Therapeutic use of radionuclides is emphasized. *Cervical, Breast and Prostate Cancer (Black and White)* Signet Imaging is a critical

component of the management of patients having radiotherapy. This book covers the basic principles of the main imaging

modalities; site specific chapters give best practice for individual tumour sites, and it also contains information on radioprotection and regulatory issues.
