At the dawn of the 1990s, as the United States celebrated its victory in the Cold War and sole superpower status by waging war on Iraq and proclaiming democratic capitalism as the best possible society, the 1990s underground punk renaissance transformed the punk scene into a site of radical opposition to American empire. Nazi skinheads were ejected from the punk scene; apathetic attitudes were challenged; women, Latino, and LGBTQ participants asserted their identities and perspectives within punk; the scene debated the virtues of maintaining DIY purity versus venturing into the musical mainstream; and punks participated in protest movements from animal rights to stopping the execution of Mumia Abu-Jamal to shutting down the 1999 WTO meeting. Punk lyrics offered strident critiques of American empire, from its exploitation of the Third World to its warped social relations. Numerous subgenres of punk proliferated to deliver this critique, such as the blazing hardcore punk of bands like Los Crudos, propagandistic crust-punk/dis-core, grindcore and power violence with tempos over 800 beats per minute, and So-Cal punk with its combination of melody and hardcore. Musical analysis of each of these styles and the expressive efficacy of numerous bands reveals that punk is not merely simplistic three-chord rock music, but a genre that is constantly revolutionizing itself in which nuances of guitar riffs, vocal timbres, drum beats, and song structures are deeply meaningful to its audience, as corroborated by the robust discourse in punk zines.

Though the deep interior of the Earth (and other terrestrial planets) is inaccessible to humans, we are able to combine observational, experimental and computational (theoretical) studies to begin to understand the role of the deep Earth in the dynamics and evolution of the planet. This book brings together a series of reviews of key areas in this important and vibrant field of studies. A range of material properties, including phase transformations and rheological properties, influences the way in which material is circulated within the planet. This circulation re-distributes key materials such as volatiles that affect the pattern of materials circulation. The understanding of deep Earth structure and dynamics is a key to the understanding of evolution and dynamics of terrestrial planets, including planets orbiting other stars. This book contains chapters on deep Earth materials, compositional models, and geophysical studies of material circulation which together provide an invaluable synthesis of deep Earth research. Readership: advanced undergraduates, graduates and researchers in geophysics, mineral physics and geochemistry.

Action Research: Using Strategic Inquiry to Improve Teaching and Learning is a core text for the Action Research course in Education. The proposed text seeks to address the needs of practitioners as it will be primarily written for use within a graduate level action research class. It will be oriented towards proactive planning as part of an organized, efficient process for developing and conducting an action research study. The book will be organized around implementation of the action research process using self-regulatory principles, which is characterized by four phases: task definition, goal setting and planning, enacting, and adapting. These four phases will be addressed as the learner considers what action research encompasses and a topic to be studied, then proceeds to establish a plan and enact it. This overall process is organized as can be seen in the Table of Contents. Michael Putnam and Tracy Rock will highlight methods

and processes that incorporate formative data that is readily available to teachers, facilitating associations between classroom instruction and the action research process. The text will also reinforce how action research can improve the teaching and learning process by reinforcing or changing perceptions about the use of informal data, including anecdotal notes or observations, in the research process.

The Action Plan for Australian Mammals 2012 is the first review to assess the conservation status of all Australian mammals. It complements The Action Plan for Australian Birds 2010 (Garnett et al. 2011, CSIRO Publishing), and although the number of

Australian mammal taxa is marginally fewer than for birds, the proportion of endemic, extinct and threatened mammal taxa is far greater. These authoritative reviews represent an important foundation for understanding the current status, fate and future of the nature of Australia. This book considers all species and subspecies of Australian mammals, including those of external territories and territorial seas. For all the mammal taxa (about 300 species and subspecies) considered Extinct, Threatened, Near Threatened or Data Deficient, the size and trend of their population is presented along with information on geographic range and trend, and relevant biological and ecological data. The book also presents the current conservation status of each taxon under Australian legislation, what additional information is needed for managers, and the required management actions. Recovery plans, where they exist, are evaluated. The voluntary participation of more than 200 mammal experts has ensured that the conservation status and information are as accurate as possible, and allowed considerable unpublished data to be included. All accounts include maps based on the latest data from Australian state and territory agencies, from published scientific literature and other sources. The Action Plan concludes that 29 Australian mammal species have become extinct and 63 species are threatened and require urgent conservation action. However, it also shows that, where guided by sound knowledge, management capability and resourcing, and longer-term commitment, there have been some notable conservation success stories, and the conservation status of some species has greatly improved over the past few decades. The Action Plan for Australian Mammals 2012 makes a major contribution to the conservation of a wonderful legacy that is a significant part of Australia's heritage. For such a legacy to endure, our society must be more aware of and empathetic with our distinctively Australian environment, and particularly its marvellous mammal fauna; relevant information must be readily accessible; environmental policy and law must be based on sound evidence; those with responsibility for environmental management must be aware of what priority actions they should take; the urgency for action (and consequences of inaction) must be clear; and the opportunity for hope and success must be recognised. It is in this spirit that this account is offered.

Nursing Interventions Classification (NIC) - E-Book Frontiers Media SA

What the book is about This book is about the theory and practice of the use of multimedia, multimodal interfaces for learning. Yet it is not about technology as such, at least in the sense that the authors do not subscribe to the idea that one should do something just because it is technologically possible. 'Multimedia' has been adopted in some commercial quarters to mean little more than a computer with some form of audio or (more usually) video attachment. This is a trend which ought to be resisted, as exemplified by the material in this book. Rather than merely using a new technology 'because it is there', there is a need to examine how people learn and communicate, and to study diverse ways in which computers can harness text, sounds, speech, images, moving pictures, gestures, touch, etc., to promote effective human learning. We need to identify which media, in which combinations, using what mappings of domain to representation, are appropriate for which educational purposes. . . The word 'multimodal' in the title underlies this perspective. The intention is to focus attention less on the technology and more on how to structure different kinds of information via different sensory channels in order to yield the best possible quality of communication and educational interaction. (Though the reader should refer to Chapter 1 for a discussion of the use of the word 'multimodal'. . .) Historically there was little problem.

Stratigraphy allows us to establish and communicate the timings for the course of Earth history and provides the means to determine the duration and rates of Earth processes. *Deciphering Earth's History: the Practice of Stratigraphy* focuses on how to apply the wide spectrum of stratigraphical techniques. It also explains how these techniques can be integrated and details their individual strengths and limitations. Chapters are laid out in a step-by-step style, guiding the reader through a recommended approach and explaining the factors to be considered. The methods are illustrated with flow charts, marginal top tips,

checklists, worked examples and over 200 figures. Authors from academia, research centres and industry have contributed to ensure a wide range of perspectives are included. In addition to chapters on each of the stratigraphical techniques there is also material on accounting for stratigraphical incompleteness, constructing geological timescales, handling and archiving stratigraphical data and the application of stratigraphy to space exploration and other disciplines. This book is designed for a wide audience ranging from advanced level undergraduates to professional practitioners wishing to use other stratigraphical techniques or understand the advantages and weaknesses of particular techniques.
