Epilepsy is one of the most common serious disorders of the brain, affecting about 50 million people worldwide. Epilepsy accounts for 1 per cent of the global burden of disease; 80 per cent of the burden of epilepsy is in the developing world, where in some areas 80-90 per cent of people with epilepsy receive no treatment at all. The Epilepsy Atlas provides an illustrative presentation of data and information on the current status of epilepsy services and care available from 160 countries, areas or territories covering 97.5 per cent of the world population. The information is primarily gathered from key persons in the area of epilepsy care in each country identified by International Bureau for Epilepsy and the International League against Epilepsy, and, in some cases, by WHO regional offices.

Beginning with the landing of the Spirit and Opportunity rovers in 2004 and concluding with the end of the Curiosity mission in 2014, this second volume of The International Atlas of Mars Exploration continues the story of Mars exploration in spectacular detail. It is an essential reference source on Mars and its moons, combining scientific and historical data with detailed and unique illustrations to provide a thorough analysis of twenty-first-century Mars mission proposals, spacecraft operations, landing site selection and surface locations. Combining a wealth of data, facts and illustrations, most created for this volume, the atlas charts the history of modern Mars exploration in more detail than ever before. Like the first volume, the atlas is accessible to space enthusiasts, but the bibliography and meticulous detail make it a particularly valuable resource for academic researchers and students working in planetary science and planetary mapping.

This new edition of Philip's International School Atlas has been expanded by 16 pages (to 160 pages in total) to include a new section on Remote Sensing and Satellite Imagery and a new selection of World Study Maps. The atlas opens with the new 11-page Remote Sensing section covering satellite imagery and GIS (with an explanation of false-colour usage), and incorporating images used in studies of mineral exploration, land reclamation, erosion, geology and pollution, with explanatory text. The next section covers World Themes, including maps on geology, volcanoes and earthquakes; temperature and ocean currents; climate (plus statistics); natural vegetation; environmental concerns; agriculture; energy and minerals; travel and tourism; population; standards of living; and international organizations. The core atlas section is made up of 74 pages of detailed World topographical maps, incorporating continental thematic maps on topics such as climate, population and economics. Completing the atlas is a series of informative World Study Maps, concentrating on special study topics in the British Isles, Switzerland, the Middle East (water and oil), China, Japan, Nigeria, Canada, the USA, the Caribbean, Brazil, Tokyo, Cairo, New York City and Mexico City,

plus world social and economic statistics. The index to the World topographical maps show letter-figure grid references as well as latitude and longitude co-ordinates. Philip's International School Atlas is a superb combination of highly detailed physical mapping backed up by numerous tables and thematic maps. The atlas is divided into sections for ease of use, with each page colour-coded for rapid reference.

Water treaties, agreements and conventions abound, but knowledge of them, and the relevant records, used to be scattered and not always easily accessible. Utilizing historical documents, statistical analyses, and maps, the Atlas presents both a graphic and textual analysis and documentation of the world's international basins and their agreements. This Atlas builds upon knowledge stored in existing environmental legislative databases in an attempt to consolidate and disseminate information about shared water treaties. It yields a better understanding of existing treaties and treaty development through time, provide a basis for negotiating new agreements, and organizes the underlying knowledge for improving environmental governance throughout the world.

The classification of tumors is important for understanding tumor histogenesis, for predicting prognosis, for differential diagnosis, and for recommending appropriate therapy. Since 1836, when pancreatic cancer was first described, progress has been made in pancreatic cancer morphology, and a number of classifications have been proposed. All of these classifications are mainly based on morphological characteristics. Some are too detailed to be of practical use while others are more pragmatic. Some of the inherent problems in the previous classifications included difficulties in obtaining an adequate number of pancreatic tumors for examination and insufficient clinical data and follow-up. With the increasing incidence of pancreatic cancer in many parts of the world during the past six decades, and with the availability of more tumors to pathologists, advances have been made in pancreatic tumor studies. Classifications by Cubilla and Fitzgerald and by Kloppel, which are generally similar, mostly considered prominent morphological features and their histogenesis. These pathology-oriented classifications, although complete, were not practical from the standpoint of clinicians concerned with the prognosis of individual tumors.
