In medical writing brevity is the kiss of life. Nevertheless most articles are unnecessarily lengthy and publications continue to multiply. Pity the poor

reader! A succession of unduly long articles is bad enough, but if each is followed by a plethora of references the effect is positively daunting. Even the reader who is impressed by the length of a list may question the author's discrimination. Were all those references needed? Were they helpful? Has the author really read every one? All too often we look in vain for evidence of selectivity. Here lies the strength of this book. The authors have combed the literature and culled it ruthlessly, selecting just a few hand-picked references on every important aspect of orthopaedic trauma. They have ranged widely but chosen narrowly, and with a sense of balance. And having selected, they have also distilled, adding a brief and thoughtful commentary on each group of entries. The four authors, of varying vintages, met at frequent intervals to discuss each section in turn and to debate the value of every inclusion. I can almost hear the cut and thrust as well-informed views were exchanged, and also the sighs of relief as differences were resolved. The authors compare their meetings with those of the Editorial Board of the IBIS; since these are a delightful mixture of conflict, entertainment and enlightenment, what a marvellous time they must have had.

This text is designed to present a comprehensive and state-of-the-art approach to dismantled complex blast injuries. Sections address care of these patients from the point of injury through rehabilitation. The specific areas addressed include blast mechanics, stabilization and hemorrhage control at the point of injury, early resuscitation at local hospitals, a systematic approach to surgical care, and finally reconstruction and rehabilitation. Specific chapters focus on operative management of pelvic, abdominal, genitourinary, orthopedic, neurological and thoracic injuries. The authors of each chapter, are experts in treating DCBIs that have had direct hands-on experience through military deployments in Iraq and Afghanistan. Each chapter describes patient presentation and an algorithm outlining treatment with support from the literature. The text will conclude with three chapters. The first explores new advances in care that can be applied to these injuries. The second highlights the organization and team approach to care of these patients. Finally, the last chapter describes an actual case, cared for by the editors, that encompasses points from the chapters in the text. Extensive illustrations and flow diagrams are used throughout the text. This text is specifically designed to be a "how to" guide for inexperienced military and civilian providers. The chapters are organized in a step-wise fashion that mirrors the patient's course from point of injury through their hospital course. Combining authors' experience with illustrations and algorithm diagrams creates a text that is easy to use as a reference text or basis of training for future military and civilian surgeons.

Trauma surgery has increasingly become a specialized field inspired by different principles and philosophy. A good trauma surgeon is a surgeon who knows how to perform abdominal vascular, thoracic, urologic, gynecologic, and orthopaedic procedures and is able to repair multiple traumatic injuries in the best sequence possible. In this first volume, practical, up-to-date guidance is provided on the optimal critical care and ICU management of trauma patients. In addition, individual chapters focus on specific injuries in orthopaedic trauma (and especially spinal trauma) and neurotrauma, with the aim of providing a fresh view of the surgical approach and practical suggestions for improving the skills of treating surgeons. Educational issues and the organization of a trauma center are also covered. The volume will be a handy pocket guide for trainee surgeons and any surgeon, physician, or nurse who treats trauma patients. It will be particularly relevant for emergency department physicians, critical care and ICU doctors, orthopaedic surgeons, neurosurgeons, and professionals responsible for trauma care and decision making, programs of trauma education, or organization of a trauma center.
