Doctors writing about menopause in France vastly outnumbered those in other cultures throughout the entire nineteenth century. The concept of menopause was invented by French male medical students in the aftermath of the French Revolution, becoming an important pedagogic topic and a common theme of doctors' professional identities in postrevolutionary biomedicine. Older women were identified as an important patient cohort for the expanding medicalisation of French society and were advised to entrust themselves to the hygienic care of doctors in managing the whole era of life from around and after the final cessation of menses. However, menopause owed much of its conceptual weft to earlier themes of women as the sicker sex, of vitalist crisis, of the vapours, and of astrological climacteric years. This is the first comprehensive study of the origins of the medical concept of menopause, richly contextualising its role in nineteenth-century French medicine and revealing the complex threads of meaning that informed its invention. It tells a complex story of how women's ageing featured in the demographic revolution in modern science, in the denigration of folk medicine, in the unique French field of *hygiène*, and in the fixation on women in the emergence of modern psychiatry. It reveals the nineteenth-century French origins of the still-current medical and alternative-health approaches to women's ageing as something to be managed through gynaecological surgery, hormonal replacement, and lifestyle intervention.

This volume clarifies in a logical and didactic manner the sequence of events that characterize the human menstrual cycle. Each major organ involved in the cycle, the brain, the pituitary gland, the ovary, and the uterus is discussed and its contribution specifically outlined. The chapters trace the physiologic events within each of these organs, describe the hormones by which they communicate, and outline how critical aspects of the cycle are synchronized so that an ovulatory cycle can occur. Thus neuroendocrine control of the menstrual cycle is examined in detail, and the processes of follicular development, maturation, ovulation, and maintenance of the corpus luteum are thoroughly covered. The book then turns to pathophysiology and examines the conditions under which the menstrual cycle may become abnormal. Pathophysiological mechanisms that cause cycle disturbance, anovulation, and infertility are reviewed, as are clinical presentations of common menstrual disorders and their treatment. Progress in reproductive biology has been rapid, and the research spans several disciplines. In this volume information dispersed in many publications has been synthesized and concisely presented, providing an in-depth understanding of the processes that control reproductive function in the female.

Across the globe, both in developed and developing countries, the population is rapidly ageing. In the fields of sexual and relationship therapy and sexual health, ageing has not been an issue of priority. Too often, ageing is thought of as a process that relates to problems, deficits, and taboos, and less to pleasure, change, growth and diversity. It is treated as a separate life stage and not a process throughout the lifecycle. Sexuality and sexual health are important parts of the lives of older people, as they have a significant impact on quality of life, psychological well-being and physical health, as well as social and family life. This book brings together contributions from those currently writing on and researching ageing as it relates, in a therapeutic context, to gender identity, to sex and sexuality, and to intimate relationships. This book was originally published as a special issue of *Sexual and Relationship Therapy*.
