Livestock Behaviour Butterworth-Heinemann

Excerpt from *Beginnings in Animal Husbandry* Agricultural education in America is comparatively new. Previous to 1870 but few colleges of agriculture existed in this country. During the period between 1870 and about 1890, interest was awakened in this field of education. Many of the agricultural colleges graduated their first classes along in the seventies. Excepting a few men who had been trained in chemistry, as applied to agriculture, there were almost no instructors who had received what we now regard as an agricultural education. The instruction known as agricultural, then consisted of lectures on familiar farm practices, frequently supplemented by manual labor on the part of the student. Text books were few, and the preparation of new ones was slow. Agricultural education under these conditions lagged, and how to encourage interest became a serious problem with the colleges. Educators insisted that the teaching should be largely based on pure science, and it was often difficult for the students to see the application. Recognizing this lack of interest, a few Western colleges conceived the plan of giving short winter courses of a popular nature, in which practical laboratory instruction should be given. Work in dairying, horticulture, and live stock judging first received attention. This practical training was most favorably regarded by the students. These winter courses grew rapidly in popularity, and paved the way for more attractive forms of instruction for the regular students. The branch of agriculture that deals with the raising of animals for the provision of food, fiber and other products is referred to as animal husbandry. Many commercial sectors are dependent on the optimum production and management of animals. These include the dairy and meat industry, aquaculture production, honey manufacture, silk farming, etc. Animals can be reared both intensively and extensively. In extensive farming, animals are allowed to roam at will. In intensive systems, they are kept in high-density feedlots, climate-controlled buildings, barns, cages, etc. and their forage is provided. There is an increased reliance on intensive animal farming and production systems suited to the land available in modern animal husbandry. Besides these, there is also an increased use of chemical and mechanized methods. Embryo transfer and artificial insemination are common practices today to improve productivity or quality of the animals. This book discusses the fundamentals as well as modern approaches of animal husbandry. It attempts to understand the multiple branches that fall under this discipline and how such concepts have practical applications. For all readers who are interested in modern animal husbandry, the case studies included herein will serve as an excellent guide to develop a comprehensive understanding.
