The Authorized Biography of a Classic Sci-Fi Series, Volume 1 documents the early career of Irwin Allen. It is a true rags-to-riches story, as Allen ventures from a humble beginning in the Bronx to his later incarnations in Hollywood as an entertainment journalist, radio and television host, a literary agent - all before becoming a successful motion picture producer and director. After winning an Academy Award in 1954, Allen entered the fantasy genre with films such as The Lost World and Voyages to the Bottom of the Sea. He then rolled the dice again with a move into television, creating and producing Voyage to the Bottom of the Sea and, one year later, Lost in Space.Lost in Space was the first primetime weekly series to take viewers into outer space's strange new alien worlds - something the networks believed impossible on a TV budget and schedule. In this book you'll be whisked back in time to the production offices, writers' conferences, and soundstages for the making of this iconic series. Included are hundreds of memos between Allen and his staff; production schedules; budgets; fan letters; more than 200 rare behind-the-scene images; and the TV ratings for every episode.

Star Trek emerged alongside mini-skirts, bellbottoms, and VW vans; flourished in the shadow of Madonna, big hair, and greed; and expanded with computers, Beanie Babies, and religious revitalization. Star Trek survived the culture shock of 9/11 and experienced a revival in the era of yoga pants, hybrid cars, and Starbucks. After more than 5 decades, Star Trek is alive and well, still voyaging through space and time. But, why is that? How has this science fiction franchise managed to anticipate and adapt to such rapid culture change? In The Voyages of Star Trek: A Mirror on American Society through Time, authors K. M. Heath and A. S. Carlisle, investigate the enduring appeal of Star Trek, noting how it has mirrored, foreshadowed, and adapted to contemporary American culture from 1966 to the present. Through anthropological analysis, the authors examine the evolution of Star Trek by tying its storylines to events and developments in the U.S., assessing the extent to which the visual image of Star Trek is reflected on the screen from “snapshots” of randomly selected episodes and all of the films. By examining how Star Trek addressed contemporary social issues through a sci-fi lens over time, the authors postulate, Americans can better understand their own changing culture. If StarTrek can continue to anticipate and adapt to our rapidly changing world, then it should remain a part of the cultural landscape for another 50 years, truly going where few franchises have gone before.

The Moody Blues have sold over 80 million records, and scored Top 20 hits in four different decades. They hit the top in 1965, with a No. 1 single, "Go Now!", and toured with the Beatles (both bands managed by Brian Epstein). But their true breakthrough came in November 1967 with the release of the classic Days of Future Passed, the first LP to combine the rock album format with orchestral music, and spawning another No. 1 single: ."Nights in White Satin." Overnight, the new genre of "symphonic rock" was born. Advancing this further, Moody Blues founding member Mike Pinder helped develop the Mellotron, a keyboard instrument which could simulate the sound of a string orchestra. This innovation not only gave the Moodies their unique sound, but enabled them to reproduce their epic albums in concert. The Moodies were also the first rock group to champion the "concept album,." following Days of Future Passed with other thematic classics, such as In Search of the Lost Chord; On the Threshold of a Dream; To Our Children's Children's Children; A Question of Balance; and Long Distance Voyager. This in-depth biography covers the magnificent 50-plus-year career of the Moody Blues (in two volumes). Exhaustively researched and featuring thousands of vintage interviews, reviews, and record chart statistics, as well as hundreds of photos. Long Distance Voyagers: The Story of the Moody Blue will whisk you back in time and put you on the very threshold of a dream.

Gene Wolfe's In Green's Jungles is the second volume, after On Blue's Waters, of his ambitious SF trilogy, The Book of the Short Sun. It is again narrated by Horn, who has embarked on a quest from his home on the planet Blue in search of the heroic leader Patera Silk. Now Horn's identity has become ambiguous, a complex question embedded in the story, whose telling is itself complex, shifting from place to place, present to past. Horn recalls visiting the Whorl, the enormous spacecraft in orbit that brought the settlers from Urth, and going thence to the planet Green, home of the blood-drinking alien inhum. There, he led a band of mercenary soldiers, answered to the name of Rajan, and later became the ruler of a city state. He has also encountered the mysterious aliens, the Neighbors, who once inhabited both Blue and Green. He remembers a visit to Nessus, on Urth. At some point, he died. His personality now seemingly inhabits a different body, so that even his sons do not recognize him. And people mistake him for Silk, to whom he now bears a remarkable resemblance. In Green's Jungles is Wolfe's major new fiction, The Book of the Short Sun, building toward a strange and seductive climax.

Sea People A&C Black

An argument that we have a moral duty to explore other planets and solar systems--because human life on Earth has an expiration date. Inevitably, life on Earth will come to an end, whether by climate disaster, cataclysmic war, or the death of the sun in a few billion years. To avoid extinction, we will have to find a new home planet, perhaps even a new solar system, to inhabit. In this provocative and fascinating book, Christopher Mason argues that we have a moral duty to do just that. As the only species aware that life on Earth has an expiration date, we have a responsibility to act as the shepherd of life-forms--not only for our species but for all species on which we depend and for those still to come (by accidental or designed evolution). Mason argues that the same capacity for ingenuity that has enabled us to build rockets and land on other planets can be applied to redesigning biology so that we can sustainably inhabit those planets. And he lays out a 500-year plan for undertaking the massively ambitious project of reengineering human genetics for life on other worlds. As they are today, our frail human bodies could never survive travel to another habitable planet. Mason describes the toll that long-term space travel took on astronaut Scott Kelly, who returned from a year on the International Space Station with changes to his blood, bones, and genes. Mason proposes a ten-phase, 500-year program that would engineer the genome so that humans can tolerate the extreme environments of outer space--with the ultimate goal of achieving human settlement of new solar systems. He lays out a roadmap of which solar systems to visit first, and merges biotechnology, philosophy, and genetics to offer an unparalleled vision of the universe to come.

"When Star Trek first premiered in 1966, viewers were shown a window into an amazing new sci-fi universe. That vision has lasted and grown for decades after - and it was fulfilled by the creativity of this legendary show's talented art directors, prop masters, and set decorators. Star Trek would not have been the same without the Burke and Origami chairs, sculptures and other decorative arts, and props used on-set. These items would not

even exist, were it not for various designers of the midcentury modern movement, such as Pierre Paulin, Joe Colombo, Paul McCobb, Warren Platner, and Milo Baughman. Authors Dan Chavkin and Brian McGuire invite you on a journey through the original series. Together, they illustrate in depth how Midcentury Modern design gave rise to the feel and aesthetic of Star Trek. Detailed, expert examination of key episodes shows how these highly influential design movements are nigh-inseparable from Star Trek -- and how they helped to shape one of the greatest visions of the future."--Back cover.

Throughout the world, closely related species are found on landmasses separated by wide stretches of ocean. What explains these far-flung distributions? Why are such species found where they are across the Earth? Since the discovery of plate tectonics, scientists have conjectured that plants and animals were scattered over the globe by riding pieces of ancient supercontinents as they broke up. In the past decade, however, that theory has foundered, as the genomic revolution has made reams of new data available. And the data has revealed an extraordinary, stranger-than-fiction story that has sparked a scientific upheaval. In *The Monkey's Voyage*, biologist Alan de Queiroz describes the radical new view of how fragmented distributions came into being: frogs and mammals rode on rafts and icebergs, tiny spiders drifted on storm winds, and plant seeds were carried in the plumage of sea-going birds to create the map of life we see today. In other words, these organisms were not simply constrained by continental fate; they were the makers of their own geographic destiny. And as de Queiroz shows, the effects of oceanic dispersal have been crucial in generating the diversity of life on Earth, from monkeys and guinea pigs in South America to beech trees and kiwi birds in New Zealand. By toppling the idea that the slow process of continental drift is the main force behind the odd distributions of organisms, this theory highlights the dynamic and unpredictable nature of the history of life. In the tradition of John McPhee's *Basin and Range*, *The Monkey's Voyage* is a beautifully told narrative that strikingly reveals the importance of contingency in history and the nature of scientific discovery.

Inside Star Trek Jacobs Brown Press

Alien Ocean immerses readers in worlds being newly explored by marine biologists, worlds usually out of sight and reach: the deep sea, the microscopic realm, and oceans beyond national boundaries. Working alongside scientists at sea and in labs in Monterey Bay, Hawai'i, the Woods Hole Oceanographic Institution, and the Sargasso Sea and at undersea volcanoes in the eastern Pacific, Stefan Helmreich charts how revolutions in genomics, bioinformatics, and remote sensing have pressed marine biologists to see the sea as animated by its smallest inhabitants: marine microbes. Thriving in astonishingly extreme conditions, such microbes have become key figures in scientific and public debates about the origin of life, climate change, biotechnology, and even the possibility of life on other worlds.
