These proceedings emanate from the Second Prouts Neck Conference on prostate cancer held on October 17-19, 1986, the theme of which was treatment, with focus on current issues and future research that is needed to answer critical questions related to optimal management of the various stages of prostate cancer. The objective was to reveal the most crucial problems impeding progress and to crystallize the combined multidisciplinary input generated by the conference into focused concepts or recommendations for presentation to the National Cancer Institute (NCI), with the ultimate intent of targeting research to address the priority issues identified. In organizing the workshop, every effort was made to maintain a multidisciplinary balance among nationally renowned authorities on prostate cancer. Thus, leading surgeons, radiation and medical oncologists and biostatisticians were in equal presence. While there were spirited exchanges with careful scrutiny and critique of all data presented, there was a

common belief that the challenge of prostate cancer would be best approached in this multidisciplinary Organ Systems-oriented fashion. During the course of the conference, it became apparent to all present that major nomenclature and procedural barriers have made it generally difficult, and frequently impossible, to compare results of clinical research.

Since the early days of medicine one concern of doctors has been the removal of kidney stones and prevention of recurrence. Owing to the hesitancy of progress in the prevention of initial stone formation and of relapse, however, removal of stones from the kidney and ureter were developed to highly refined techniques and they formerly accounted for a major proportion of the urological operations performed. In the last few years

developments in the treatment of kidney stones have taken a completely different turn. In the majority of cases suit able methods are available to bring about spontaneous passage of the stones, while in a smaller proportion drug-induced litholysis is possible. Stones that cannot be passed are now treated mainly with extra corporeal shockwave lithotripsy, percutaneous litholapaxy or uretero renoscopy. These methods are often used in combination and complement each other. Nonetheless, despite the accumulating experience with the new methods there will still be situations in which stones can not be removed except by open surgery. "Our skill as surgeons and the management of the brilliantly designed equipment would amount to nothing more than highly skilled mechanical work if they did not go hand in hand with enhanced insight into the cause of lithiasis and thus into ways of preventing it - or at least of preventing the relapse that is the lot of most patients.

Despite the rising popularity of the minimally invasive laparoscopic option, open nephron-sparing surgery is still seen by many experts as the 'gold standard' for open surgery for kidney tumors and should remain the first choice for many patients.
