This casebook provides a set of cases that reveal the current complexity of medical decision-making, ethical reasoning, and communication at the end of life for hospitalized patients and those who care for and about them. End-of-life issues are a controversial part of medical practice and of everyday life. Working through these cases illuminates both the

practical and philosophical challenges presented by the moral problems that surface in contemporary end-of-life care. Each case involved real people, with varying goals and constraints, who tried to make the best decisions possible under demanding conditions. Though there were no easy solutions, nor ones that satisfied all stakeholders, there are important lessons to be learned about the ways end-of-life care can continue to improve. This advanced casebook is a must-read for medical and nursing students, students in the allied health professions, health communication scholars, bioethicists, those studying hospital and public administration, as well as for practicing physicians and educators.

The modern synthetic diet, formulated to appeal to our inherent attraction to sugar, salt, fats, and calories at the expense of nutrition, leaves us overfed and under-nourished. A considerable portion of

chronic human diseases, including diabetes and heart disease, appear to be related largely to a diet that is inadequate in the essential vitamins, minerals, phytonutrients, and other constituents found in natural, unprocessed foods.

A compelling vision of a new reality, a reconciliation of science and the human spirit for a future that will work. The dynamics underlying the major problems of our time—cancer, crime, pollution, nuclear power, inflation, the energy shortage—are all the same. We have reached a time of dramatic and potentially dangerous change, a turning point for the planet as a whole. We need a new vision of reality, one that allows the forces transforming our world to flow together as a positive movement for social change. Now distinguished scientist

Fritjof Capra gives us that vision, a holistic paradigm of science and spirit. "This splendid and thoughtful book is an essential guide for anyone inquiring about the place of science and metascience in our contemporary culture. Those who enjoyed Fritjof Capra's *Tao of Physics* should not expect a sequel; this is a much more ambitious book that attempts and succeeds in presenting a whole worldview from the viewpoint of a committed and experienced physicist who also writes from within the North American culture.... It is unusually detailed and thorough in its inclusion of the conventional and the alternative approaches to topics ranging from ecology through medicine and psychology to economics. It is at once scholarly and easy to read."—Jim Lovelock, *New Scientist*

Principles of Immunopharmacology provides a unique source of essential knowledge on the immune response, its diagnosis and its modification by drugs and chemicals. The 4th edition of this internationally recognized textbook has

been revised to include recent developments, but continues the established format, dealing with four related fields in a single volume, thus obviating the need to refer to several different textbooks. The first section of the book, providing a basic introduction to immunology and its relevance for human disease, has been updated to accommodate new immunological concepts, particularly the role of epigenetics and the latest understanding of cancer immunology. The second section on immunodiagnosics offers a topical description of widely used molecular techniques and a new chapter on imaging techniques. This is followed by a systematic coverage of drugs affecting the immune system, including natural products. This third section contains 15 updated chapters, covering classical immunopharmacological topics such as anti-asthmatic, anti-rheumatic and immunosuppressive drugs, but also deals with antibiotics, plant-derived and dietary agents, with new chapters on monoclonal antibodies, immunotherapy in sepsis

and infection, drugs for soft-tissue autoimmunity and cell therapy. The book concludes with a chapter on immunotoxicology and drug safety tests. Aids to the reader include a two-column format, glossaries of technical terms and appendix reference tables. The emphasis on illustrations is maintained from the first three editions. The book is a valuable single reference for undergraduate and graduate medical and biomedical students, postgraduate chemistry and pharmacy students, researchers in chemistry, biochemistry and the pharmaceutical industry and researchers lacking basic immunological knowledge, who want to understand the actions of drugs on the immune system.

Marked by names such as W. B. Yeats, James Joyce and Patrick Pearse, the decade 1910–1920 was a period of revolutionary change in Ireland, in literature, politics and public opinion. What fed the creative and reformist urge besides the circumstances of the moment and a vision of the future? The leading experts in Irish history, literature and culture assembled in this volume argue that the shadow of the past was also a driving factor: the traumatic, undigested memory of the defeat and death of the charismatic national leader Charles Stewart Parnell (1846-1891). The authors reassess Parnell's impact on the Ireland of his time, its cultural, religious, political and intellectual life, in order to trace his posthumous influence into the early twentieth century in fields such as political activism, memory culture, history-writing, and literature.

 Since Darwin, Biology has
 been framed on the idea
 of evolution by natural
 selection, which has
 profoundly influenced the
 scientific and
 philosophical
 comprehension of
 biological phenomena and
 of our place in Nature.
 This book argues that
 contemporary biology
 should progress towards
 and revolve around an
 even more fundamental
 idea, that of autonomy.
 Biological autonomy
 describes living organisms
 as organised systems,
 which are able to self-
 produce and self-maintain

as integrated entities, to
 establish their own goals
 and norms, and to
 promote the conditions of
 their existence through
 their interactions with the
 environment. Topics
 covered in this book
 include organisation and
 biological emergence,
 organisms, agency, levels
 of autonomy, cognition,
 and a look at the
 historical dimension of
 autonomy. The current
 development of scientific
 investigations on
 autonomous organisation
 calls for a theoretical and
 philosophical analysis.
 This can contribute to the
 elaboration of an original
 understanding of life -
 including human life - on
 Earth, opening new
 perspectives and enabling
 fecund interactions with
 other existing theories
 and approaches. This
 book takes up the
 challenge.

The cranial nerves are an endlessly fascinating family of twelve nerves that have a dramatic impact on our daily lives. A dysfunction of the cranial nerves can cause loss of vision or double vision, loss of smell, poor balance, or loss of muscle function, and can also be an indicator of underlying neurological disorders.

The *Clinical Anatomy of the Cranial Nerves: The Nerves of "On Old Olympus Towering Top"* is an engaging and accessible book on the anatomy and clinical importance of these unique nerves. The text opens with a brief introduction of key neuroanatomical concepts that relate the clinical and anatomical sections that follow. Additionally, this book uniquely provides a detailed description of the bones of the head and face in order for the reader to understand the

routes taken by the cranial nerves through the skull. Chapters then detail each nerve and its unique impact in relationship to our senses, motor function, and health.

Vividly illustrated and supported by real-life clinical cases, the book will appeal to anyone wishing to gain a better understanding of the cranial nerves. Merging anatomical and clinical information with intriguing clinical cases, *The Clinical Anatomy of the Cranial Nerves: The Nerves of "On Old Olympus Towering Top"* introduces readers to the anatomy and diverse function of this intriguing family of nerves.

In recent years, interest in the management of anterior skull base tumors has been fostered by the introduction and subsequent rapid expansion of indications of transnasal endoscopic techniques. In parallel, extraordinary progress has been made in all the other disciplines which are involved in the complex process of managing anterior skull base tumors, leading to substantial improvements in diagnosis and

treatment. The anterior skull base can be involved in a large variety of tumors of a varying nature and histology, which in the majority of cases originate from adjacent anatomic sites. In fact, primary lesions of the anterior skull base mainly include osteoma and other tumors originating from bone and cartilage. Tumors involving the anterior skull base have their origin prevalently in the sinonasal tract, but lesions developing on the intracranial site, such as meningiomas, may also extend caudally to encroach upon this area. All these lesions are rare, which means that the pertinent literature does not include prospective studies or treatment guidelines based on a high level of evidence. In view of the extreme histological variability of lesions involving the anterior skull base, much emphasis has been placed on addressing the different nuances of treatment in relation to histology, especially for malignant tumors. The chapters focusing on surgery provide divergent views on selection criteria for a specific surgical technique, which is the aim of this publication.
