Erde und Weltwirtschaft: Allgemeine Geographie des Welthandels und des Weltverkehrs, von E. Otremba Fischer Gustav Verlag GmbH & Company KG

This book brings together twenty essays on diverse topics in the history and science of knots. It is divided into five parts, which deal respectively with knots in prehistory and antiquity, non-European traditions, working knots, the developing science of knots, and decorative and other aspects of knots. Its authors include archaeologists who write on knots found in digs of ancient sites (one describes the knots used by the recently discovered Ice Man); practical knotters who have studied

the history and uses of knots at sea, for fishing and for various life support activities; a historian of lace; a computer scientist writing on computer classification of doilies; and mathematicians who describe the history of knot theories from the eighteenth century to the present day. In view of the explosion of mathematical theories of knots in the past decade, with consequential new and important scientific applications, this book is timely in setting down a brief, fragmentary history of mankind's oldest and most useful technical and decorative device — the knot. Contents: Prehistory and Antiquity: Pleistocene Knotting Why Knot? — Some Speculations on the First Knots On Knots and Swamps — Knots in European Prehistory Ancient Egyptian Rope and Knots Non-European Traditions: The Peruvian Quipu The Art of Chinese Knots Works: A Short History Inuit Knots Working Knots: Knots at Sea A History of Life Support Knots Towards a Science of Knots?: Studies on the Behaviour of Knots A History of Topological Knot Theory of Knots Trambles Crochet Work — History and Computer Applications Decorative Knots and Other Aspects: The History of Macramé A History of Lace Heraldic Knots On the True Love Knot and other papers Readership: Mathematicians, archeologists, social historians and general readers.

His boots heavy with mud, Fornax Nehrengel marched zombie-like through the bleak and raw dawn. He wore the face of exhaustion, wincing as each step brought forth a fresh dose of pain from the untreated blister oozing puss from between his toes. His dark skin and hair were grimy, his legs and arms sore. From deep within his belly an unheated breakfast of gruel protested its confinement. Indifference deadened his spirit and his eyelids drooped with fatigue. The black scowl etched into his face said it all. Fear. Exhaustion. Pain. Through chapped and broken lips Fornax Nehrengel silently cursed his plight. He was not a brave man. Indeed, he found it curiously ironic that he should be fighting to defend a flag he paid scant allegiance to. Fornax resented being here and desertion was on his mind. . . Now, join Fornax Nehrengel on an intense, light-speed adventure that zooms from the moon to Mars and back again. With him is an undercover Secret Service agent, a crusty old economics professor, a nefarious brother, and a hot-blooded young woman. And chasing them? A power-hungry elite intent on stealing what could be mankind's most important invention since the internal combustion engine. Who said science fiction can't be sexy and fun at the same time?

Knot theory is a kind of geometry, and one whose appeal is very direct because the objects studied are perceivable and tangible in everyday physical space. It is a meeting ground of such diverse branches of mathematics as group theory, matrix theory, number theory, algebraic geometry, and differential geometry, to name some of the more prominent ones. It had its origins in the mathematical theory of electricity and in primitive atomic physics, and there are hints today of new applications in certain branches of chemistry. The outlines of the modern topological theory were worked out by Dehn, Alexander, Reidemeister, and Seifert almost thirty years ago. As a subfield of topology, knot theory forms the core of a wide range of problems dealing with the position of one manifold imbedded within another. This book, which is an elaboration of a series of lectures given by Fox at Haverford College while a Philips Visitor there in the spring of 1956, is an attempt to make the subject accessible to everyone. Primarily it is a text book for a course at the junior-senior level, but we believe that it can be used with profit also by graduate students. Because the algebra required is not the familiar commutative algebra, a disproportionate amount of the book is given over to necessary algebraic preliminaries.

An insight into the latest results from the world of operations research - a wide-ranging field, as is shown by the book's 24 sections, corresponding to the conference program itself. Although problems of a primarily methodological nature are discussed, the emphasis is placed firmly on practical subjects, such as reports from the fields of healthcare, environmental protection, logistics and traffic engineering. This selection also clearly illustrates the extent to which OR is spreading into and already interwoven in other scientific disciplines.
