Hepatobiliary and pancreatic surgery is a relatively new specialty and the vast majority of patients present initially outside tertiary referral centres. Many conditions such as gallstones, acute and chronic pancreatitis, obstructive jaundice and malignancies of the liver, biliary tract and pancreas are still managed outside specialist centres or are not suitable for referral. Many general surgeons continue to manage these problems and in some parts of the world the geography and distances involved makes referral for specialist care difficult or impossible. The relative scarcity of specialist centres for the management of these difficult conditions also means that the majority of trainees do not get sufficient exposure prior their definitive appointment to equip them with the tools needed to confidently manage many of the problems they may face. Operative Solutions in Hepatobiliary and Pancreatic Surgery combines clearly written, practical text with over 200 illustrations and numerous flow charts which take the reader through the management of all the commonly encountered hepatobiliary and pancreatic pathologies and procedures. All aspects of hepatobiliary and pancreatic surgery are discussed in a clear and consistent style, while the flow charts are designed to be modified by the reader to adapt them to local practice and the facilities and expertise available. This book is invaluable for the senior trainee or newly appointed specialist who requires clear, practical advice on how to manage the wide range of problems that present to surgeons outside specialist centres.

Pancreatic Disease Springer

Excerpt from *Diseases of the Pancreas and Their Surgical Treatment* It is only within recent years that any material progress in regard to our knowledge of the functions and diseases of the pancreas has been made. The admirable works of Korte and Oser, the fruitful researches of Opie and others into the functions and significance of the islands of Langerhans, the observations lately made as to the causation and treatment of acute and chronic pancreatitis, - have all attracted much attention from the profession, and have excited a keener interest in the pathology and treatment of the diseases of this gland. The publication of a work dealing with the surgical aspects of pancreatic disease may therefore be held to have a twofold object: to record and to review the work done in the past, and to indicate, so far as is possible, the scope and trend of future research. This has been our intention, and these have been our aims in the present work; and though we recognize fully its incompleteness, we venture to think that this is, in no small measure, inevitable in the present state of our knowledge.
