Proceedings of the 3rd World Conference on Detergents William Andrew

Originally published in 1993, over 16,000 tradename surface-active agents for industrial applications, manufactured worldwide, are contained in this edition. General-use surfactants, such as emulsifiers, wetting agents, foaming agents, detergents, dispersants, and solubilizers are included, as well as detergent raw materials, defoamers, and antifoaming agents. The types and quantities of surfactants available commercially are numerous and the difficulty in making choices between products may become overwhelming. It is the purpose of this book to guide those who are involved in the selection of these materials through the process of identifying, classifying, and selecting the most appropriate products for their requirements. Therefore, this reference is organized so that the user can search for and locate products based on a variety of essential distinguishing attributes.

The term surfactant comes from the words surface active agent. A surfactant is briefly defined as a material that can greatly reduce the surface tension of water when used in very low concentrations. These are one of many different compounds that make up a detergent. They are added to remove dirt from skin, clothes and household articles particularly in kitchens and bathrooms. They are also used extensively in industry. A disinfectant or agent that frees from infection is ordinarily a chemical agent which kills disease germs or other harmful micro-organisms and is applied to inanimate objects. The specific way in which a disinfectant agent is used is dependent on both the desired objective and the infectious agent present. Growing emphasis on health, safety and sanitation is fuelling demand for disinfectants & surfactants across industries such as food processing, healthcare and consumer. Personal care industry in India is very huge and is one of the main key drivers for Indian surfactants market. Surfactants industry has a large market for consumer products. This handbook contains processes formulae of various products and providing information regarding manufacturing method. It covers raw material suppliers, photographs of plant & machinery with supplier's contact details and some plant layout & process flow sheets. The major contents of the book are phenyl, floor cleaner, glass cleaner, toilet cleaner, mosquito coils, liquid detergent, detergent powder, detergent soap, naphthalene balls, air freshener, shoe polish, toothpaste, shaving cream, liquid soaps and hand-washes, herbal shampoo, heena based hair dye, herbal creams, utensil cleaning bar, hand sanitizer etc. It will be a standard reference book for professionals,

Updated recipes eliminate Borax (banned as a food additive in the US and from cosmetic and cleaning products in the EU) from ingredient lists, replacing it with safe substitutes that include citric acid powder, hydrogen peroxide, diatomaceous earth, cornstarch, washing soda, and baking soda. New recipes show readers how to make easy, nontoxic, environmentally friendly substitutes for popular cleaning products, including molded laundry and dishwasher tablets. Packaging updates emphasize the use of glass containers for homemade cleaning products, to diminish environmental impact of plastic waste.

Scientific Study from the year 2018 in the subject Chemistry - Organic Chemistry, grade: A, , language: English, abstract: How does an increase in temperature and a change in concentration of cationic surfactant Benzalkonium Chloride affects the cleaning ability of different floor cleaners measured in terms of change in surface tension using the stalagmometric method? What makes a floor cleaner exhibit cleaning ability? The major ingredient in the production of floor cleaners is Benzalkonium Chloride (BKC). There are several other surfactants available but this is commonly found in most of the floor cleaners. BKC, a cationic surfactant, has had several uses since it was

introduced. Developed by a group of German scientists in the 1910s as a germicide, it was first used medicinally as a preservative for hard contact lens solutions and skin disinfectant. Today, there are thousands of different products that contain this chemical. There are various methods like capillary rise, drop and analysis to find the surface tension of a liquid. However, all the methods require machines and apparatus that are not easily available and are also expensive. Therefore, the stalagmometric method was the only feasible method that also gave reliable results. In order to find the floor cleaners that were common a survey was conducted in the local residential area.
