Report of the 90-day Study on Human Exploration of the Moon and Mars

Bloomsbury Publishing USA

In the past, men like Leonardo da Vinci and Jules Verne imagined the future and envisioned fantastic inventions such as winged flying machines, submarines, and parachutes, and posited human adventures like transoceanic flight and journeys to the Moon. Today, many of their ideas are reality and form the basis for our modern world. While individual visionaries like da Vinci and Verne are remembered for the accuracy of their predictions, today entire nations are involved in the process of envisioning and defining the future development of mankind, both on and beyond the Earth itself. Recently, Russian, European, and Chinese teams have all announced plans for developing their own next generation human space vehicles. The Chinese have announced their intention to conduct human lunar exploration, and have flown three crewed space missions since 2003, including a flight with three crew members to test their extravehicular (spacewalking) capabilities in September 2008. Very soon, the prestige, economic development, scientific discovery, and strategic security advantage historically associated with

leadership in space exploration and exploitation may no longer be the undisputed province of the United States. Much like the sponsors of the seafaring explorers of da Vinci's age, we are motivated by the opportunity to obtain new knowledge and new resources for the growth and development of our own civilization. NASA's new Constellation Program, established in 2005, is tasked with maintaining the United States leadership in space, exploring the Moon, creating a sustained human lunar presence, and eventually extending human operations to Mars and beyond. Through 2008, the Constellation Program developed a full set of detailed program requirements and is now completing the preliminary design phase for the new Orion Crew Exploration Vehicle (CEV), the Ares I Crew Launch Vehicle, and the associated infrastructure necessary for humans to explore the Moon. Component testing is well underway, and integrated flight testing will begin in 2009. This white paper summarizes 3 years of Constellation Program progress and accomplishments, and it describes the foundation set for human lunar return in 2020. Rhatigan, Jennifer L. This e-book contains the 2013 Revision of RDA: Resource Description and Access, and includes the July 2013 Update. This e-book offers links within the RDA text and the capability of running rudimentary searches of RDA, but please note that this e-book does not have the full range of content or functionality provided by the subscription product RDA Toolkit.

Included: A full accumulation of RDA the revision contains a full set of all current RDA instructions. It replaces the previous version of RDA Print as opposed to being an update packet to that version. RDA has gone through many changes since it was first published in 2010. Cataloging practice described by RDA has not changed dramatically due to the changes above, but nearly every page in RDA Print was impacted by the changes, with the result that an RDA Print update packet would require nearly as many pages as the full revision. The most current RDA the revision contains all changes to RDA up to and including the 2013 RDA Update approved by the JSC. Annually the JSC considers proposals to update, enhance and maintain RDA as a current cataloging standard. These updates can and often do change the cataloging process as described by RDA. The JSC also periodically issues changes to RDA to fix errors and to clarify meaning. These changes do not typically change cataloging practice as described by RDA. Reworded RDA the revision includes the reworded version of RDA instructions. To improve readability and comprehension of complex instructions, RDA has been edited

and reworded since its original release.

The rewording was carried out by the JSC, RDA Copy Editor, and reviewed by the U.S. RDA Test Coordinating Committee.

This two-volume encyclopedia looks at the lives of teenagers around the world, examining topics from a typical school day to major issues that teens face today, including bullying, violence, sexuality, and social and financial pressures. Teenagers are living in a rapidly changing and increasingly interconnected yet unequal world. Whether they live in Australia or Zimbabwe, they have in common that they are between childhood and adulthood and increasingly aware of how inequality is affecting their lives and futures. This encyclopedia gives a different perspective based on the experiences of teens in 60 countries. Each entry gives the reader a brief sketch of a country to help readers to understand how geography, history, economics, and politics shape teen life. The entries include a country overview and cover the following topics: Schooling and Education; Extracurricular Activities: Art, Music, and Sports; Family and Social Life; Religions and Cultural Rites of Passage; Rights and Legal Status; and Issues Today. Special sidebars, called Teen Voices, appear throughout the text, and include a description of a typical day in the life of a teen in various countries. Students will be able to gain a better understanding of what life is like around the world for their peers and will be able to easily make cross-cultural comparisons between different countries.

Windows Server 2016 Administration Fundamentals BoD - Books on Demand The liquid oxygen (LOX) reactivity results using the ambient pressure LOX mechanical impact test did not yield

reproducible results for halogenated (precision cleaning) solvents tested at the Johnson Space Center (JSC), the White Sands Test Facility (WSTF), and at the Marshall Space Flight Center-Materials Combustion Research Facility (MCRF-MSFC) to replace the precision cleaning solvent, HCFC 225 (AK225). The ambient pressure LOX impact testing is established in the ASTM G86-98 test method and is specified by Test 13A in NASA STD 6001(B). In this test method, a known amount of energy is transferred from a free falling plummet to a striker pin resting directly on the test specimen immersed in LOX. The WSTF impact tester produced higher reactivity rates at lower energy levels for the same tests performed at MSFC. This indicates factors other than total input energy to the sample influence the materials reactivity in LOX.

Penetration (calibrated) drop tests were performed at WSTF and MSFC. The penetration drop tests provide a simple and reliable method for verifying impact energy, but this method does not provide a measurement of other factors that may contribute to the material's sensitivity to impact reactions. This paper discusses the interaction of factors that are not clearly addressed in the ASTM G86-98 test method and that should be an important focus of attention. Many variables were examined, including percent of relative humidity during sample preparation, the use of the plummet (rebound) catcher, variability of sample preparation at each facility, and impact testing with and without the insert disks. These and other variables attribute to the wide differences in reactivity. More standardization and controls in the test protocol, along with further testing and improvements, are recommended. It is hoped that the insight and observations of the NASA independent assessment (IA) team will provide useful support and discussions for improving the standard test method that is used for ambient pressure LOX impact testing.

The second book of the four-volume edition of "Solar cells" is devoted to dye-sensitized solar cells (DSSCs), which are considered to be extremely promising because they are made of low-cost materials with simple inexpensive manufacturing procedures and can be engineered into flexible sheets. DSSCs are emerged as a truly new class of energy conversion devices, which are representatives of the third generation solar technology. Mechanism of conversion of solar energy into electricity in these devices is quite peculiar. The achieved energy conversion efficiency in DSSCs is low, however, it has improved

quickly in the last years. It is believed that DSSCs are still at the start of their development stage and will take a worthy place in the large-scale production for the future.

Today's astronauts require many different abilities. They must not only be expert in performing flight simulations but must also be proficient in such dissimilar subjects as photography, thermodynamics, electrical repairs, flight procedures, oceanography, public affairs, and geology. In *Prepare for Launch*, the author introduces the technologies and myriad activities that constitute or affect astronaut training, such as the part-task trainers, emergency procedures, the fixed-based and motion-based simulators, virtual environment training, and the demands of training in the Weightless Environment Training Facility. With plans to return to the Moon and future missions to Mars, the current selection criteria and training are very different from those used for short duration mission Space Shuttle crews. Dr. Erik Seedhouse in this book focuses on how astronaut candidates are taught to cope with different needs and environments (for example, hibernation, artificial gravity, and bioethics issues) and also includes brief discussions of the astronaut application and selection process.
