Lea's Chemistry of Cement and Concrete deals with the chemical and physical properties of cements and concretes and their relation to the practical problems that arise in manufacture and use. As such it is addressed not only to the chemist and those concerned with the science and technology of silicate materials, but also to those interested in the use of concrete in building and civil engineering construction.

Much attention is given to the suitability of materials, to the conditions under which concrete can excel and those where it may deteriorate and to the precautionary or remedial measures that can be adopted. First published in 1935, this is the fourth edition and the first to appear since the death of Sir Frederick Lea, the original author. Over the life of the first three editions, this book has become the authority on its subject. The fourth edition is edited by Professor Peter C. Hewlett, Director of the British Board of Agreement and visiting Industrial Professor in the Department of Civil Engineering at the University of Dundee. Professor Hewlett has brought together a distinguished body

of international contributors to produce an edition which is a worthy successor to the previous editions.

Neural Information Processing Elsevier Most current state-of-the-art overview of this important class of compounds, encompassing many new and emerging applications The number of articles on organic azides continues to increase tremendously; on average, there are more than 1000 new publications a year Covers basic chemistry as well as state-of-the-art applications in life science and materials science World-ranked authors describe their own research in the wider context of azide chemistry Includes a chapter on safe synthesis and handling (azides can

decompose explosively)

"Over the past decade, Carothers has established himself as the leading U.S. expert on democracy promotion. He is a powerful critic not only of the nuts-and-bolts of democracy assistance but also of U.S. grand strategy overall."—SAIS Review Promoting the rule of law has become a major part of Western efforts to spread democracy and market economics around the world. Yet, although programs to foster the rule of law abroad have mushroomed, well-grounded knowledge about what factors ensure success, and why, remains scarce. In Promoting the

Rule of Law Abroad, leading practitioners and policy-oriented scholars draw on years of experience—in Russia, China, Latin America, Central and Eastern Europe, the Middle East, and Africa—to critically assess the rationale, methods, and goals of rule-of-law policies. These incisive, accessible essays offer vivid portrayals and penetrating analyses of the challenges that define this vital but surprisingly little-understood field. Contributors include Rachel Belton (Truman National Security Project), Lisa Bhansali (World Bank), Christina Biebesheimer (World Bank), Thomas Carothers (Carnegie Endowment), Wade Channell, Stephen Golub, and David Mednicoff (University of Massachusetts, Amherst), Laure-Hélène Piron (Overseas Development Institute), Matthew Spence (Yale Law School), Matthew Stephenson (Harvard Law School), and Frank Upham (NYU School of Law).

In ten years 80 per cent of the legislation related to economics, maybe also to taxes and social affairs, will be of Community origin." This declaration has been largely quoted, paraphrased and deformed by different authors, creating a persistent

myth according to which 80% of the legislative activity of the national legislatures would soon be reduced to the simple transposition of European norms". This book addresses the topic of the scope and impact of Europeanization on national legislation, as a part of the Europeanization debate which raises normative concerns linked to the "democratic deficit" debate. The state of the art shows that there are many assumptions and claims on how European integration may affect national legislation and, more generally, domestic governance but that there is a lack of solid and comparative data to test them. The aim of the book is to give a solid and comparative insight into Europeanization focusing on effective outcomes in a systematic way. This book analyzes the period 1986-2008 and includes an introduction, a global overview of European legislative activities which set the background for Europeanization of national legislatures, 9 country contributions (8 EU member states + Switzerland) including systematic, comparative and standardized data, tables and figures, and a conclusion with a comparative analysis of the European and

domestic reasons for Europeanization. All national contributions conclude that Europeanization of national legislation is much more limited than assumed in the literature and public debate. It is limited to 10 to 30% of laws (depending on the country), far less than the 80% predicted by Jacques Delors and mentioned daily by medias and public opinion leaders to demonstrate EU domination on member states. Beside that general statement, the various chapters propose a deep insight on EU constraint over national legislation, providing much information on the kind of laws and policies that are Europeanized, the evolution of this process through time, the impact of Europeanization on the balance of powers and the relations between majority and opposition at national level, the strategies developed by national institutions in that context, and many other issues, making the book of interest to academics and policy-makers concerned with Europeanization and national legislation.

In recent years, the field of Toxinology has expanded substantially. On the one hand

it studies venomous animals, plants and micro organisms in detail to understand their mode of action on targets. While on the other, it explores the biochemical composition, genomics and proteomics of toxins and venoms to understand their three interaction with life forms (especially humans), development of antidotes and exploring their pharmacological potential. Therefore, Toxinology has deep linkages with biochemistry, molecular biology, anatomy and pharmacology. In addition, there is a fast developing applied subfield, clinical toxinology, which deals with understanding and managing medical effects of toxins on human body. Given the huge impact of toxin-based deaths globally, and the potential of venom in generation of drugs for so-far incurable diseases (for example, Diabetes, Chronic Pain), the continued research and growth of the field is imminent. This has led to the growth of research in the area and the consequent scholarly output by way of publications in journals and books. Despite this ever growing body of literature within biomedical sciences, there is still no all-inclusive reference work available that collects all of the important biochemical,

biomedical and clinical insights relating to Toxinology. The Handbook of Toxinology aims to address this gap and cover the field of Toxinology comprehensively.

"Oceanian ceramic cultures making earthenware pottery spread during the past 3500 years through a dozen major island groups spanning 6000 km of the tropical Pacific Ocean from western

Micronesia to western Polynesia. Island potters mixed sand as temper into clay bodies during ceramic manufacture. The nature of island sands is governed by the geotectonics of hotspot chains, island arcs, subduction zones, backarc basins, and remnant arcs as well as by sedimentology. Because small islands with bedrock exposures of restricted character are virtual point sources of sand, many tempers are diagnostic of specific islands. Petrographic study of temper sands in thin section allows distinction between indigenous pottery and exotic pottery transported from elsewhere. Study of 2223 prehistoric Oceanian potsherds from 130 islands and island clusters indicates the nature of Oceanian temper types and documents 105 cases of interisland transport of ceramics over distances typically

The phenomenon of clefts is beyond doubt a golden oldie. It has captivated linguists of different disciplines for decades. The fascination arises from the unique syntax of clefts in interaction with their pragmatic and semantic interpretation. Clefts

structure sentences according to the information state of the constituents contained in them. They are special as they exhibit a rather uncommon syntactic form to achieve the separation of the prominent part, either focal or topical, from the background of the clause. Despite the long-lasting interest in clefts, linguists have not yet come to an agreement on many basic questions. The articles contained in this volume address these issues from new theoretical and empirical perspectives. Based on data from about 50 languages from all over the world, this volume presents new arguments for the proper derivation of clefts, and contributes to the ongoing debate on the information-structural impact of cleft structures. Theoretically, it combines modern syntactic theorizing with investigations at the interface between grammar and information-structure. *Cement Chemistry* Thomas Telford "What is the meaning of Africa and being an African? What is and what is not African philosophy? Is philosophy part of Africanism? These are the kinds of fundamental questions that this book addresses. V. Y. Mudimbe argues that the

various discourses themselves establish the worlds of thought in which people conceive their identity. Western anthropology and missionaries have introduced distortions not only for outsiders but also for Africans trying to understand themselves. Mudimbe goes beyond the classic issues of African anthropology or history. He says that the book attempts an archeology of African gnosis as a system of knowledge in which major philosophical questions recently have arisen: first, concerning the form, the content, and the style of Africanizing knowledge; second, concerning the status of traditional systems of thought. He is directly concerned with the processes of transformation of different types of knowledge." -- P. 4 of cover.

This is the fourth global report under the follow-up to the ILO Declaration on Fundamental Principles and Rights at Work. It examines diverse forms of discrimination at work and considers various policy and practical responses to tackle this problem. The book finds that the benefits of eliminating discrimination in the workplace go beyond the individual level and extend to the economy and to society, leading to the efficient use of human resources and diverse talents, improved worker morale and motivation, better labour relations and productivity gains.

The three-volume set of LNCS 12532, 12533, and 12534 constitutes the proceedings of the 27th International

Conference on Neural Information Processing, ICONIP 2020, held in Bangkok, Thailand, in November 2020. Due to COVID-19 pandemic the conference was held virtually. The 187 full papers presented were carefully reviewed and selected from 618 submissions. The papers address the emerging topics of theoretical research, empirical studies, and applications of neural information processing techniques across different domains. The second volume, LNCS 12533, is organized in topical sections on computational intelligence; machine learning; robotics and control.

Promoting the Rule of Law Abroad
Geological Society of America

H F W Taylor was for many years Professor of Inorganic Chemistry at the University of Aberdeen, Scotland. Since 1948, his main research interest has been the chemistry of cement. His early work laid the foundations of our understanding of the structure at the nanometre level of C-S-H, the principal product formed when cement is mixed with water, and the one mainly responsible for its hardening. Subsequent studies took him into many additional aspects of the chemistry and materials

science of cement and concrete. His work has been recognized by Fellowships and by other honours and awards from many scientific societies in the UK, USA and elsewhere. This second edition of Cement chemistry addresses the chemistry and materials science of the principal silicate and aluminate cements used in building and Civil engineering. Emphasis throughout is on the underlying science. The book deals more specifically with the chemistry of Portland cement manufacture and the nature of the resulting product, the processes that occur when this product is mixed with water, the nature of the hardened material, the chemistry of other types of hydraulic cement, and chemical and microstructural aspects of concrete, including processes that affect its durability. Since the first edition of this book was published in 1990, research throughout the world has greatly augmented our knowledge in all of these areas. The present edition has been updated and revised to take account of these advances. The reader will acquire a solid understanding of the subject and will be better equipped to deal with the problems and pitfalls that can arise in

engineering practice as a result of inadequate understanding of the relevant chemistry. It will serve both as an introduction to those entering the subject for the first time and as a guide to the latest developments for those already experienced in the field.

Zeolite Microporous Solids: Synthesis, Structure, and Reactivity CRC Press

This book contains the results and findings of the advanced research carried out in a pilot area with a thorough investigation of the structure and functioning of an aquifer in a granitic formation. It characterizes the hard rock aquifer system and examines its properties and behavior as well as systematically details the geophysical, geological and remote sensing applications to conceptualize such an aquifer system.

This book introduces physics students and teachers to the historical development of the kinetic theory of gases, by providing a collection of the most important contributions by Clausius, Maxwell and Boltzmann, with introductory surveys explaining their significance. In addition, extracts from the works of Boyle, Newton, Mayer, Joule, Helmholtz, Kelvin and others show the historical context of ideas about gases, energy and irreversibility. In addition to five thematic essays connecting the classical kinetic theory with 20th century topics such as indeterminism and interatomic forces, there is an extensive international bibliography of historical commentaries on kinetic theory, thermodynamics, etc. published in the past four decades. The book will be useful to historians of science who need primary and secondary sources to be conveniently available for their own research and interpretation, along with the bibliography which makes it easier to learn what other historians have already done on this subject.
