Micronutrients and Brain Health addresses cutting-edge research related to processes of oxidative stress that affect brain function, an area of increasing significance for those concerned and involved with public health and translational medicine. Edited by four leading micronutrient researchers, the book brings together the investigative work of more than 70 leading researchers from across the world. Chapters identify brain-specific micronutrients that support function as well as the molecular mechanisms underlying their neuroprotectant activity. These explore age-related metabolic pathways, mitochondrial nutrients, neurodegeneration and micronutrients, cell signaling, and neuronal functions. General chapters are included on brain structure, function, and metabolism, while several other chapters are devoted to the role of specific micronutrients. The book explores how brain micronutrients are found to be both metabolic and redox regulators, thereby establishing a cross-talk between the major pathways involved in modulation of cell signaling and gene expression. Specific areas of research covered include: Uses of nutritional interventions to target age-related neuronal and behavioral deficits Effects of various micronutrients on Alzheimer's disease, including lipoic acid, green tea, and Ginkgo biloba extracts Nutrients specific to essential mitochondrial functions Cognitive and behavioral consequences of iron deficiency with specific emphasis on women of reproductive age Omega-3 fatty acids and their relation to brain function in the elderly Challenges inherent in the development of neuroprotective-neurorescue drugs This book belongs to the groundbreaking CRC Press Series on Oxidative Stress and Disease. The series now includes more than two dozen volumes that address increasing evidence regarding the multiple ways that oxidative stress initiates and accelerates disease mechanisms. Most importantly, this book, like the series, offers invaluable information regarding nutritional and lifestyle choices, and pharmaceutical interventions that can be employed to prevent, control, and even ameliorate disease processes attributed to oxidative stress.

Today, intrauterine insemination (IUI) is one of the primary procedures performed while treating less severe causes of infertility like ovulatory dysfunction, cervical hostility, early endometriosis, mild male factor problems and even in those with unknown etiology. In spite of this widespread popularity, there is considerable variation in ultimate result reported. This inconsistency could be attributed to lack in uniformity in patient selection, clinical execution and technology used. Divided into seven sections covering topics related to general, andrology, ovulation, special situations, var.

Neutron stars are the most compact astronomical objects in the universe which are accessible by direct observation. Studying neutron stars means studying physics in regimes unattainable in any terrestrial laboratory. Understanding their observed complex phenomena requires a wide range of scientific disciplines, including the nuclear and condensed matter physics of very dense matter in neutron star interiors, plasma physics and quantum electrodynamics of magnetospheres, and the relativistic magneto-hydrodynamics of electron-positron pulsar winds interacting with some ambient medium. Not to mention the test bed neutron stars provide for general relativity theories, and their importance as potential sources of gravitational waves. It is this variety of disciplines which, among others, makes neutron star research so fascinating, not only for those who have been working in the field for many years but also for students and young scientists. The aim of this book is to serve as a reference work which not only reviews the progress made since the early days of pulsar astronomy, but especially focuses on questions such as: "What have we learned about the subject and how did we learn it?", "What are the most important open questions in this area?" and "What new tools, telescopes, observations, and calculations are needed to answer these questions?". All authors who have contributed to this book have devoted a significant part of their scientific careers to exploring the nature of neutron stars and understanding pulsars. Everyone has paid special attention to writing educational comprehensive review articles with the needs of beginners, students and young scientists as potential readers in mind. This book will be a valuable source of information for these groups.

This book examines the making of the Goddess Durga both as an art and as part of the intangible heritage of Bengal. As the 'original site of production' of unbaked clay idols of the Hindu Goddess Durga and other Gods and Goddesses, Kumartuli remains at the centre of such art and heritage. The art and heritage of Kumartuli have been facing challenges in a rapidly globalizing world that demands constant redefinition of 'art' with the invasion of market forces and migration of idol makers. As such, the book includes chapters on the evolution of idols, iconographic transformations, popular culture and how the public is constituted by the production and consumption of the works of

art and heritage and finally the continuous shaping and reshaping of urban imaginaries and contestations over public space. It also investigates the caste group of Kumbhakars (Kumars or the idol makers), reflecting on the complex relation between inherited skill and artistry. Further, it explores how the social construction of art as 'art' introduces a tangled web of power asymmetries between 'art' and 'craft', between an 'artist' and an 'artisan', and between 'appreciation' and 'consumption', along with their implications for the articulation of market in particular and social relations in general. Since little has been written on this heritage hub beyond popular pamphlets, documents on town planning and travelogues, the book, written by authors from various fields, opens up cross-disciplinary conversations, situating itself at the interface between art history, sociology of aesthetics, politics and government, social history, cultural studies, social anthropology and archaeology. The book is aimed at a wide readership, including students, scholars, town planners, heritage preservationists, lawmakers and readers interested in heritage in general and Kumartuli in particular.

While many books explore the possibilities for developing inclusive practices in schools, and 'inclusion' is widely regarded as a desirable goal, much of the literature on the subject has been narrowly concerned with the inclusion of pupils with special educational needs. This book however, takes the view that marginalisation, exclusion and underachievement take many forms and affect many different kinds of child. As such, a definition of inclusion should also touch upon issues of equity, participation, community, entitlement, compassion, respect for diversity and sustainability. Here the highly regarded authors focus on: barriers to participation and learning experienced by pupils the practices that can overcome these barriers the extent to which such practices facilitate improved learning outcomes how such practices can be encouraged and sustained within schools and LEAs. The book is part of the Improving Learning series, published in partnership with the Teaching and Learning Research Project.

This new addition to Springer's series on Key Thinkers in World Education tracks the intellectual and philosophical journey of a trail-blazing innovator whose ideas have fired the imaginations of progressive educationalists for almost a century. The volume's in-depth analysis of the educational philosophy of Bengali polymath Rabindranath Tagore offers an unrivalled focus on his highly influential views. Tagore—poet, internationalist, humanist, and the first non-European to win the Nobel Prize for literature—lived on the cusp of change between two momentous centuries in world civilization and foresaw the dissolution of colonialism and the globalization of culture. His ideas on education placed the creative individual at the centre of the quest for knowledge. Eschewing the artificial distinctions between elementary and higher learning, he advocated the importance of sowing the seed of humanism as early as possible, and fostering the individual's enjoyment of education as well as their courage to challenge conventions. In doing so, he anticipated the modern concern with critical thinking at the same time as he was encouraging independence of thought and action as a counter to colonial oppression and condensation. Concise yet thorough, this volume on one of the most original thinkers of the last century covers every aspect of Tagore's highly original educational philosophy. *Autophagy in tumor and tumor microenvironment* IGI Global The development of new and effective analytical and numerical models is essential to understanding the performance of a variety

This book deals with the paradoxical role of autophagy in tumor suppression and tumor promotion in cancer cells. Autophagy plays opposing, context-dependent roles in tumors; accordingly, strategies based on inhibiting or stimulating autophagy could offer as potential cancer therapies. The book elucidates the physiological role of autophagy in modulating cancer metastasis, which is the primary cause of cancer-associated mortality. Further, it reviews its role in the differentiation, development, and activation of multiple immune cells, and its potential applications in tumor immunotherapy. In addition, it examines the effect of epigenetic modifications of autophagy-associated genes in regulating tumor growth and therapeutic response and summarizes autophagy's role in the development of resistance to a variety of anti-cancer drugs in cancer cells. In closing, it assesses autophagy as a potential therapeutic target for cancer treatment. Given its scope, the book offers a valuable asset for all oncologists and researchers who wish to understand the potential role of autophagy in tumor biology.

"What is health?" This has not been a simple inquiry to reply. Health isn't seen similar route by all individuals from a local area, including different experts for instance heads and social researchers, leading to disarray about the idea of health. Allow us momentarily to take a gander at the changing idea of health. Generally, health has been seen as "nonattendance of sickness". As such, if an individual was not experiencing any illness, she was viewed as sound. This idea, known as the biomedical idea, depended on the "germ hypothesis of illness", which ruled clinical idea from the finish of the nineteenth century onwards. The clinical calling viewed the human body as a machine and infection as an outcome of the breakdown of the machine, fundamentally achieved by germs. The biomedical idea of health has been viewed as inadmissible as it disregards the job of ecological, social, social and mental determinants of health. This idea of health was discovered lacking to clarify a portion of the serious issues of humankind, like hunger, ongoing sicknesses, drug misuse, psychological instability and so forth Inadequacies in the biomedical idea brought about different ideas of health, similar to the biological and psychosocial ideas.
