Stock Investing for Students Allen & Unwin

Invest in common stocks? Gary Wilson believes almost everyone needs to invest in common stocks. Only common stocks have the ability to grow in value at a sufficient rate to meet retirement goals and provide the average investor with the ability to beat the inroads of inflation. In fact, he believes an investor needs an average return of 15% to meet all of an investor's needs. Is an average return of 15% doable? Gary answers that question in this book. He goes even further, teaching the small investor how to meet this target return. This book includes the information a small investor needs to use common stocks to prepare for the future. He also includes common stock recommendations and the tools to evaluate some of these recommendations. The world is changing. The world of investing is changing. What does all this mean to the average investor trying to meet his day to day needs? Gary provides answers to this question and many more. He examines such things as derivatives, exchange traded funds, mutual funds and more in addition to just common stocks. Practical guidance is provided for evaluating and using some of the newer investments available to all common stock investors. Yes, the world is changing, and the world of investing is changing too. Yesterday, it was enough to invest in the United States. Today an investor must think globally. Tomorrow, the small investor will not have the luxury of ignoring international markets. We are moving rapidly to a global economy characterized by a limited number of leading stock exchanges open twenty-four hours per day. The global economy is moving towards a limited number of leading currencies used in global trade. Either we invest accordingly, or we will find ourselves assigned to the backwashes of the world.

Goal-based investing is a new paradigm that is expected to have a profound and long-lasting impact on the wealth management industry. This book presents the concept in detail and introduces a general operational framework that can be used by financial advisors to help individual investors optimally allocate their wealth by identifying performance-seeking assets and hedging

assets. Grounded in the principles of asset pricing and portfolio optimisation, the goal-based investing approach leads to the design of investment solutions that truly respond to investors' problems, which can most often be summarized as follows: secure essential goals with the highest confidence level and maximize the chances to reach aspirational goals. A series of case studies guides the reader through the implementation of goal-based investing, illustrates the efficiency of this paradigm and explains how one can accommodate a variety of implementation features such as taxes, short-sales constraints, parameter estimation risk, as well as limited customisation.

Investors ask the wrong questions. Will the stock market rise or fall in the next month? What is the best place to put my money right now? Will interest rates rise or fall? Will the economy improve or get worse? What will be the best performing stock during the next year? The problem with all of these questions is that the answers are unknowable and will always be so. Dwelling on the unknowable is a fruitless quest that will not bring investors any closer to achieving long-term financial goals. Our fundamental problem is that we are using the wrong part of the brain. Cognitive Investing explains how to make investment decisions using the portion of the brain better suited for the task and answers the questions investors should be asking. What is the relationship between the economy and the stock market? What is the difference between investing and gambling? Why is selling much more difficult than buying? How important is diversification? Why do natural psychological urges lead us to make poor investing decisions? Understanding the answers to these and many more essential questions will profoundly and fundamentally transform the way you approach investing.
