Excerpt from Plumbing: A Working Manual of American Plumbing Practice, Including Approved Fixtures, Piping Systems, House Drainage, and Modern Methods of Sanitation Modern methods of sanitation as well as the complications introduced by the development of the city building, have in late years placed responsibilities on the professional plumber far beyond the ability to wipe a joint and solve the ordinary drainage problems of a frame dwelling. The successful plumber must not only be a good workman who knows where to use lead pipe and where to use brass and iron, how to properly place the drains and the piping, and how to properly mount the fixtures; but he must be versed in the principle of sanitation, the proper location of tanks, the sizes of

water and drainage pipe, the laws of water flow, pressure, and many other questions involved in giving to any dwelling, office building, or factory, adequate and well designed water and drainage systems. This means that the up-to-date plumber must really be a sanitary engineer and it is to give the practical man authoritative information on these subjects that this little volume has been published. The article covers a discussion of the latest types of plumbing fixtures; house water supply with practical examples and diagram showing methods of installation; pumps and service pipes; connections for hot-water systems with temperature regulators; filters and water motors; gas piping and meter reading; sewage disposal and purification; sewer

construction; and the description of a complete house drainage system. The authors are both men of reputation and long experience in practical plumbing work, and it is their hope as well as that of the publishers that this volume will prove of distinct value to the professional plumber as well as to those who are only interested in keeping in touch with modern progress. Plumbing Engineering Design Handbook, Volume 3, Special Plumbing Systems

This publication describes the processes involved in the design installation and maintenance of modern plumbing

systems. It recommends a number of plumbing system design and installation specifications that have demonstrated their validity from years of experience. It also examines the microbiological chemical physical and financial risks associated with plumbing and outlines the major risk management strategies that are used in the plumbing industry and emphasizes the importance of measures to conserve supplies of clean water. This work is dedicated to assisting developing countries in achieving the best possible plumbing levels to ensure the highest health benefits from use of sound plumbing practices. It is aimed at administrators and plumbers working in areas that are served by a mains drinking- water supply or sewerage system or are about to install a mains

drinking- water supply or sewerage system. It should be of particular value to those working in countries or areas that are in the early stages of introducing modern plumbing systems. While it draws attention to the problems of drinking- water supply and waste removal in developing countries and outlines some of the strategies currently used it does not systematically cover issues specific to developing countries.
