Women have long searched for a pleasing birth—a birth with a minimum of fear and pain, in the company of supportive family, friends, and caregivers,

a birth that ends with a healthy mother and baby gazing into each other's eyes. For women in the Netherlands, such a birth is defined as one at home under the care of a midwife. In a country known for its liberal approach to drugs, prostitution, and euthanasia, government support for midwife-attended home birth is perhaps its most radical policy: every other modern nation regards birth as too risky to occur outside a hospital setting. In exploring the historical, social, and cultural customs responsible for the Dutch way of birth, Raymond De Vries opens a new page in the analysis of health care and explains why maternal care reform has proven so difficult

in the U.S. He carefully documents the way culture shapes the organization of health care, showing how the unique maternity care system of the Netherlands is the result of Dutch ideas about home, the family, women, the body and pain, thriftiness, heroes, and solidarity. *A Pleasing Birth* breaks new ground and closes gaps in our knowledge of the social and cultural foundations of health care. Offering a view into the Dutch notion of maternity care, De Vries also offers a chance of imagining how Dutch practices can reform health care in the U.S. not just for mothers and babies, but for all Americans.

A Book for Midwives
Saunders
Although proven effective in protecting pregnancy, giving birth

and breastfeeding – that is, the biological differences of women related to maternity – the current European Union (EU) legislative framework on maternity leave tends to overlook the roles of both parents, especially during the post-delivery period of ‘bonding’ with the child. This framework, along with EU law on parental leave, which does not encourage an equal take-up of the leave, gives rise to serious issues of gender equality affecting both men and women. This deeply researched and urgent book proposes alternative options for future EU law on child-related leave which can be applied to both employees and self-employed workers to mitigate these

limitations and side effects. Analysing the various EU Directives which, directly or indirectly, relate to maternity leave, paternity leave, adoption leave and parental leave, as well as the corresponding case law of the Court of Justice of the EU, the author uses a social risk approach and tackles the following issues: narrow focus of the legislation on the delivering mother’s incapacity to work; in practice, excessive emphasis on the protection of the delivering mother; silent assent to the unequal distribution of caring responsibilities within the family; lack of attention to women’s labour market outcomes; and the new direction followed by the

recently adopted Directive on work-life balance. The research focuses on working parents (including non-delivering parents in same-sex couples or adoption) and includes a comparative analysis of the law of six countries – Belgium, Ireland, Spain, the United Kingdom, Sweden and Portugal – chosen to illustrate the variety of national schemes available and how their desirable features can be introduced into EU law. A more balanced design of child-related leave is a must in today's society for reasons of fairness and also for economic considerations. This complete analysis of EU legislation and case law about child-related leave – including the first-ever systematic

and in-depth analysis on whether maternity leave can be considered discriminatory against fathers and a review of economic literature on how child-related leave affects the situation of women in the labour market – offers forward-looking solutions for child-related leave to enhance gender equality. Practitioners and nongovernmental organisations dealing with EU and national matters related to labour and employment law, social security law and gender equality law will welcome this important book, as will academics and policymakers interested in maternity and other child-related leaves.

Birthing Autonomy

This title is directed primarily towards health care professionals outside of the United States. This book explores the complex interrelationship between risk and choice in maternity care, taking a close look at how "high" and "low" risk are defined and what impact this has on a woman's ability to exercise informed choices throughout pregnancy. It offers an international collaboration that highlights different perspectives on debated issues, with chapters on maternity care in the UK, United States, Australia, and Ireland contributed by midwives, obstetricians, risk

management experts, and sociologists. The aim of this book is to illustrate the changing reality of risk management as it relates to maternity care, and to highlight risk management concerns that may limit the choices available to pregnant women. Clarifies how applications of risk affect the choices pregnant women are able to exercise. Locates pregnancy risk considerations within the overall scheme of risk management. Analyzes practitioners' responses to the requirements of risk management. Presents risk management and choice from the risk manager's perspective, providing an understanding of risk as a "macro concept" in health care.

Highlights medico-legal opinions on exercising choice, underscoring the need for accurate information and the ability to make informed decisions. Two chapters examine women's perspectives on risk labeling and the impact this has on choice - one in which the concept of safety within maternity care is discussed, and one in which the views of women with defined risk factors are explored and their ability to make choices is evaluated. Two chapters written by health service risk managers discuss the differences between an inner-city approach and a rural approach to the debate surrounding risk and choice. Discusses midwifery's focus on "normality" in childbirth and

considers how this viewpoint affects the risk dialogue, including a chapter on clinical trends in maternity care. An obstetric perspective on risk refutes criticisms of obstetricians as being more likely to impose risk labels and limit choices by discussing how risks and choices are presented and considered within obstetric care. Explores the debate surrounding a woman's right to have a home birth in Ireland, in light of its risk management climate. Two chapters discuss the collaboration between service users, midwives, and obstetricians in Australia regarding the organization and delivery of maternity care, as well as the views concerning risk

among indigenous Australians. Perspectives from nurse-midwives in the U.S. discuss the complex relationships among nurse-midwives, obstetricians, and pregnant women with regard to choice, including views on risk within immigrant communities.

A Pleasing Birth

Routledge Birthing Autonomy brings some balance to the difficult arguments that arise from debates about home births, and focuses on women's views and their experiences of planning home births. It provides an in-depth exploration of how women make decisions about home births and what aspects matter most to them. Comparing how

differently the pros and cons of home births are constructed and contemplated by mothers and by the medical profession, the book looks at how current obstetric thinking and practices can disempower and harm women emotionally and spiritually as well as physically. Written in an accessible style, this book is enlightening for student and practicing midwives and obstetricians, as well as researchers and students of nursing, medical sociology, health studies, gender studies, feminist practitioners and theorists. It will also be invaluable to expectant mothers who want to be more informed about the choices they are facing and the

wider context within which their birth options are considered. *Pleasing Birth* National Academies Press

Supporting a Physiologic Approach to Pregnancy and Birth: A Practical Guide provides an overview of current evidence and a range of practical suggestions to promote physiologic birth within the United States healthcare system. Presenting the latest evidence available on practical approaches and minimal interventions, this book looks into clinic exam rooms and hospital labor units to investigate the possibilities for improving the pregnancy and labor experience. Contributors discuss recent research and other published

information and present a range of ideas, tools, and solutions for maternity care clinicians, including midwives, nurses, physicians, and other members of the perinatal team. An invaluable resource, *Supporting a Physiologic Approach to Pregnancy and Birth* is a must-have practical guide for those involved in all aspects of pregnancy and birth.

The Institute of

Medicine (IOM) of the National Academy of Sciences (NAS) collaborated in this study with the Board on Maternal, Child, and Family Health Research of the Commission on Life Sciences of the National Research Council (NRC) to determine methodologies needed to evaluate current childbirth settings in the United States. Although the proportion of non-hospital births runs as high as 4.4 percent annually in Oregon, insufficient data exist to permit complete evaluation of the various birth settings. The application of good research methods should lead to scientific findings that provide the basis for informed, rational decision making about

alternative settings for childbirth. A committee of 11 experts was appointed to review current knowledge, provide background knowledge, and identify the kinds of research designs useful for assessing such matters as the safety, quality of maternity care, costs, psychological factors, and family satisfaction of different birth settings. The committee was also charged with preparing a report that could be used to solicit, evaluate, and fund proposals for studies on childbirth settings. The committee did not design specific studies to be carried out, but rather attempted to point out issues that should be considered by researchers because it believed

that the best proposals would arise from investigator-initiated research. Gaps in research could be filled by requests for proposals developed by agency staff and the agency peer review committee. In addition, IOM staff members and several consultants provided background papers for the committee's consideration. The research that results from this report will be useful to policymakers and to consumers searching for information to aid in making decisions about birth settings.

Research Issues in the Assessment of Birth Settings summarizes the study.

Over the last hundred years, pregnancy and childbirth has become increasingly safe – yet it is still a site of risk, and a contested ground on which health professionals and pregnant women both face high costs of error. In this context, all those involved in managing pregnancy and birth are expected to identify and mitigate risk: pregnant women are subject to increasing surveillance to ensure the safety of the unborn foetus, and every aspect of childbearing is increasingly medicalised. This publication brings together fascinating social science research to explore the ways in

which risk is both created and managed in pregnancy and childbirth. The introductory chapters reflect on the changing social context of childbirth, in particular the medicalisation of both pregnancy and childbirth with development of specialist practitioners, such as obstetricians and midwives who claim to have the knowledge, technology and skills to identify and manage the risks involved. The next three chapters that examine the ways in which women's behaviour during pregnancy is constructed as potentially risky -- for example smoking, drinking alcohol and taking drugs, and how these risks are monitored and

mitigated. The final two parts of the book address the construction of and responses to both medicalisation and risk in childbirth.

Altogether, it represents a valuable insight into the complex world of pregnancy, childbirth and risk. This book brings together editorials and articles originally published in special and open issues of *Health, Risk and Society*.

This book addresses the politics of global health and social justice issues around birth, focusing on dynamic communities that have chosen to speak truth to power by reforming dysfunctional health care systems or creating new ones outside the box. The chapters present models of childbirth at extreme ends of a spectrum—from the conflict zones and disaster areas of Afghanistan, Israel, Palestine, and Indonesia, to high-risk tertiary care settings in China, Canada, Australia, and Turkey. Debunking notions about best care, the

volume illustrates how human rights in health care are on a collision course with global capitalism and offers a number of specific solutions to this ever-increasing problem. This volume will be a valuable resource for scholars and students in anthropology, sociology, health, and midwifery, as well as for practitioners, policy makers, and organizations focused on birth or on social activism in any arena.
