Assists clinicians in managing their time to the greatest advantage and providing professional treatment to all patients simultaneously As inpatient psychiatric facilities face bed shortages and increasingly limited insurance coverage for their programs, partial hospitalization and intensive outpatient programs are growing within the mental health treatment community. This book provides clinicians (including social workers, counselors, therapists, and psychiatric nurses) new to partial hospitalization and intensive outpatient practice settings with a conceptual framework and practical skills for effective and efficient practice. It helps clinicians to develop realistic expectations for treatment in a managed care environment with limited time and funding. Partial hospitalization and intensive outpatient treatment programs (PHPs/IOPs) can present particularly stressful environments in which clinicians are engaged in multiple treatment processes with groups of diverse patients, all at different points in the treatment process. This book borrows the "ecology of games" concept from political theory to assist clinicians in managing their time to the greatest advantage and providing professional treatment to all patients simultaneously. It describes the key elements of a PHP/IOP, including treatment planning, discharge planning, group therapy, psychoeducation, and safety and confidentiality issues. It then addresses challenges unique to specific patient populations in the program--children, adults, older adults, the chronically mentally ill, the chemical dependent, individuals with co-occurring disorders--and offers strategies for coping with the multitude of issues they present. Key Features: Provides practical strategies for handling a variety of clinical issues in the PHP/IOP setting Covers specific problems and treatment planning goals for varied populations Guides clinicians in developing realistic expectations for treatment in a managed care environment with limited time and funding Includes chapters dedicated to coping with a death in a

Filling a significant gap in the clinical literature, this unusually practical manual addresses the nuts-and-bolts issues involved in conducting group therapy. Featuring contributions from leading experts in the field, the volume covers everything from determining which patients will benefit from a group experience to step-by-step instructions for running group sessions as effectively as possible. Organized in a unique, logical sequence, the chapters begin with an explanation of how to select patients for a particular group intervention and how groups are composed. The different stages of group interaction over time are then covered in detail, as are the changing aspects of the therapist's role during the various stages. Setting forth basic principles of group technique—including the management of resistance, transference, primitive group dynamics, and countertransference—a clear distinction is drawn between the roles of therapists conducting group treatment and therapists working in other treatment modalities.

For many psychiatrists and other mental health professionals, the clinical review is the most burdensome and disagreeable part of managed care. In that review they are asked, by a representative of the managed care company, to justify their patient's need for care and to defend the treatment they are providing. Clinicians usually feel at a disadvantage in these discussions because they are never quite sure what information the reviewer needs to approve the patient's care. This does not have to be the case. The goal of this book is to teach psychiatrists, mental health professionals, and administrators how reviewers think and how to conceptualize, present, and document clinical care in a manner that greatly increases the likelihood that reviewers will approve their request for care. Beginning with five questions that must be answered in every managed care review, the author discusses the following key topics and many others. Presenting your case to a reviewer -- How to effectively present requests for inpatient, partial hospital, and substance abuse care and avoid common mistakes that decrease the likelihood that your request will be approved. How to answer the four clinical questions that must be addressed in every review even if they are not asked by the reviewer. Negotiating with the reviewer -- How to negotiate with a reviewer who is reluctant to approve the care you request. Writing effective notes -- How to write effective clinical notes in the patient's record that substantiate your request for care and increase the likelihood that it will be approved. Dealing with unethical reviewers -- How to identify and take action against unethical reviewers and managed care companies that are insensitive to your patient's clinical needs.

Appealing denials of care -- How to appeal denials of care when you do not agree with the reviewer's decision. These and many other important issues are highlighted in brief vignettes illustrating a clinician's presentation of a patient's case and a typical reviewer's comments. This tremendously useful volume will be welcomed by every mental health care practitioner who must negotiate the current managed care landscape.

[1970 Census Data Used to Indicate Areas with Different Potentials for Mental Health and Related Problems](#) Taylor & Francis

There was a time, not long ago, when the only treatment options considered to be worthwhile for patients requiring psychiatric care were the 50-minute hour on the one hand, or full-time hospitalization on the other. Most of us were convinced in those days that treatment could, and indeed should, take place with a minimum of involvement by the patient's family. Nor did we really consider that the community in which a patient lived was a significant contributor to either his illness or its cure. These naive assumptions were strongly challenged, of course, beginning with the questions of social psychiatrists in the 50s and continuing with the quiet growth of the patients' rights movement. Thus it is no mere coincidence that when the community psychiatry movement emerged in the mid-60s as a powerful force for profound change in our traditional practice, the concept of partial hospitalization, which can be traced back at least 30 years, became a symbol of the new social psychiatry. Partial hospitalization had singular advantages well attuned to the times: it did not force a separation between the patient and his family; it cost far less to deliver than inpatient care; and it avoided the stigma of institutionalization while still providing far more care than the traditional psychotherapeutic hour. In a few years' time, several well controlled studies documented that virtually all patients who were customarily treated on an inpatient basis could be effectively managed and treated in a day hospital.
