Of the seven contributors, five have direct experience of working with or in intelligence, and all have written extensively on the subject.

"This book aims to fill a gap in the process of confrontation between the disciplines, case laws and literature of the central EU member states. In particular it aims to address the difficulty of finding sources for scholars and professionals explaining the rules and guidelines of corporate law in the different European states. The main features of the discipline of Corporate Law in Germany, England, France, Italy, Spain, Poland, Romania and the Netherlands are illustrated. The objective of the work is not only to describe the main features of the discipline, but especially to highlight the most important critical profiles, and particularly those under the scrutiny of the case law and most studied (as problematic) by the doctrine."--Bloomsbury Publishing.

This new book by Sister Aquinata Böckmann discusses the Prologue and chapters 1, 2, and 3 of the Rule of St. Benedict. In a lectio regulae she plumbs the depths of Benedict's vision. Listen, the first word of the Prologue, is a keyword that describes the main stance of the individual monastic, the superior, and the entire community. Listening to the Scriptures and in them to Christ guides individuals and the community on how to "run on the way of God's commandments" toward the goal of communal life in and with Christ. The first three chapters of the Rule concretize the principles of this communal spirituality of listening: the importance of a rule and a pastor for maintaining the community's attentiveness to life; the superior's responsibility to listen to individuals within the community; and the mutual listening between leader and community members, regardless of their age. As in her earlier books Sister Aquinata proves to be a true guide into the spirit of Benedict's Rule, which provides sound principles for listening in common in a community of life.

*A Guide to Kernel Exploitation: Attacking the Core* discusses the theoretical techniques and approaches needed to develop reliable and effective kernel-level exploits, and applies them to different operating systems, namely, UNIX derivatives, Mac OS X, and Windows. Concepts and tactics are presented categorically so that even when a specifically detailed vulnerability has been patched, the foundational information provided will help hackers in writing a newer, better attack; or help pen testers, auditors, and the like develop a more concrete design and defensive structure. The book is organized into four parts. Part I introduces the kernel and sets out the theoretical basis on which to build the rest of the book. Part II focuses on different operating systems and describes exploits for them that target various bug classes. Part III on remote kernel exploitation analyzes

the effects of the remote scenario and presents new techniques to target remote issues. It includes a step-by-step analysis of the development of a reliable, one-shot, remote exploit for a real vulnerability bug affecting the SCTP subsystem found in the Linux kernel. Finally, Part IV wraps up the analysis on kernel exploitation and looks at what the future may hold. Covers a range of operating system families — UNIX derivatives, Mac OS X, Windows Details common scenarios such as generic memory corruption (stack overflow, heap overflow, etc.) issues, logical bugs and race conditions Delivers the reader from user-land exploitation to the world of kernel-land (OS) exploits/attacks, with a particular focus on the steps that lead to the creation of successful techniques, in order to give to the reader something more than just a set of tricks

In this volume many of the world's leading authorities collate these advances and provide information about current practices, thus equipping researchers and students to successfully construct new tests using the best modern standards and techniques. The first section explains the benefits of considering the underlying theory when designing tests, such as factor analysis and item response theory. The second section looks at item format and test presentation. The third discusses model testing and selection, while the fourth goes into statistical methods that can find group-specific bias. The final section discusses topics of special relevance such as multi-trait multi-state analyses and development of screening instruments.
