Clinical Anatomy: A Case Study Approach
Lippincott Williams & Wilkins

Arthroplasty of the upper extremity is an established surgical intervention in the management of arthritis of the elbow, wrist and hand. The anatomy, kinematics and demands of the elbow, wrist, thumb CMC, and finger MCP and PIP joints pose unique surgical challenges. Implant design considerations are important in providing a joint that mimics the native joints and maximizes survivorship. However, outcomes are less predictable in these upper extremity joints when compared to the hips and knees. Each joint also carries

its own set of potential complications and salvage options for revision and failed arthroplasty. This unique text helps the orthopedic and hand surgeon understand the surgical approaches, unique anatomic considerations, and both the historical and current designs related to each respective joint, enabling the surgeon to better appreciate the benefits and limitations of each arthroplasty. Presenting the current state of the art, the seven sections proceed anatomically from the elbow to the fingers, with each section comprised of three thematic chapters discussing implant design considerations, primary arthroscopy techniques and revision arthroscopy techniques, including non-surgical options for treating these often difficult problems. This consistent approach, accompanied by plentiful figures, radiographs and intraoperative photos, ensures that this will be a user-friendly resource for orthopedic and hand surgeons, residents and trainees.

Implement TMR with Your Patients and Improve Their Quality of Life Developed by Dr. Todd A. Kuiken and Dr. Gregory A. Dumanian, targeted muscle reinnervation (TMR) is a new approach to accessing motor control signals from peripheral nerves after amputation and providing sensory feedback to prosthesis users. This practical approach has many advantages over other neural-machine interfaces for the improved control of artificial limbs. Targeted Muscle Reinnervation: A Neural

Interface for Artificial Limbs provides a template for the clinical implementation of TMR and a resource for further research in this new area of science. After describing the basic scientific concepts and key principles underlying TMR, the book presents surgical approaches to transhumeral and shoulder disarticulation amputations. It explores the possible role of TMR in the prevention and treatment of end-neuromas and details the principles of rehabilitation, prosthetic fitting, and occupational therapy for TMR patients. The book also describes transfer sensation and discusses the surgical and functional outcomes of the first several TMR patients. It concludes with emerging research on using TMR to further improve the function and quality of life for people with limb loss. With contributions from renowned leaders in the field, including Drs. Kuiken and Dumanian, this book is a useful guide to implementing TMR in patients with high-level upper limb amputations. It also supplies the foundation to enable improvements in TMR techniques and advances in prosthetic technology. [Hand And Upper Extremity Reconstruction E-Book](#) Elsevier Health Sciences
