Math enthusiasts aren't necessarily the number-crunching geeks we tend to assume. In fact, they know that math is about much more than numbers; it is a profoundly philosophical endeavor, as well as a stimulating mental exercise. In *How the Other Half Thinks*, Sherman Stein emphasizes the creative element of mathematics by exploring some significant mathematical discoveries through simple, intuitive manipulations. With an ingenious technique that uses no algebra or trigonometry, and only a minimum of arithmetic, Stein takes us through the thought process behind some of math's great discoveries and applications. Each chapter begins with a simple question about strings made up of the letters a and b, which leads to other, more profound questions. Along the way, we become familiar with concepts from such fields as topology and probability, and learn how they have led to applications such as codes and radar, computing, and even baseball statistics. Recreational and instructive, *How the Other Half Thinks* will appeal to die-hard math enthusiasts (of which there are many) as well as those "right-brainers" who are looking for a way to understand and enjoy math.

Math literally was created to problem solve. The cool thing that it's a science that tries to calculate the exact answer and not an approximation. This means that I am always in search of the exact answer without any kind of misdirection. Why does this matter? Life is short and we all want the most out of Life so why not calculate Happiness and Success? Why try hard for an unexpected outcome, I think that seems a little unfair don't you think? Well I figured out by using math I can calculate my Health, Income, Happiness, and my Life just by always using the principles in Math and I want to share the guaranteed success with you! What is Mathemology? Mathemology is a way of living using the principles of Math to derive the desired outcome that you seek. In simple terms "Get what you want out of LIFE!" If you can calculate each step, each choice, each action as much as possible, you will see yourself evolve and succeed and finally live the life you always desired. It's all in your mind. Math is the language of GOD. It is what it is and it resembles truth which is a divine quality that we all possess and share. Focus on solutions and watch your problems go away. Learn the principles well and share them with the people who surround you and who are closest to you. This will help create a better environment and it will be a gift that keeps giving. Be fully dedicated to doing the right thing that you consciously know is right. Do this for you and to others and the Universe will repay you even in ways that were not perceivable prior to them happening. Using Math as a way of thinking will help you in every way that you use it. Don't be afraid to commit to the right answer and to always seek the right solution for yourself and your situation. Calculate your every move the best you can and stay focused on your life and what your meaning is. Be true to yourself and to others at all times so that you can live a true life. Do the best you can in everything that you do and do the best for others too. Create the image in your mind of who you want to be and start right away to achieve that image don't be afraid to surpass if it may be. No matter what there is always an answer. You can think of the hardest math equation the longest math equation the most unique math

equation and no matter what there will always be an answer, even if you don't know it and even if you will never know it, but no matter what there will always be an answer. Even though the answer isn't always known or easy to come by it is important to always seek the right answer and not to settle or get deterred from the work it takes to get it. It is still always better to be close to the right answer than far away. The closer you are the easier it is to obtain, so you might not get it right away but your work always pays off. Now when you start again you have a closer starting point and now you have a better and easier chance of getting the right answer or what you want. This is a personal guide for your life journey in this universe. Put as much effort as you can and fill it out with as much detail as you can. Keep this close to you and reference this personal book and watch yourself grow. Keep this as a record of who you are and who you want to be. Cheers!

Madeline Reddicks "I think it's important for kids to be creative through languages, which are basically codes...and to see learning as fun; which it is!" Born in Seattle, Washington, Madeline Reddicks (daughter of Tommy Reddicks) lives in Penzance, Cornwall, UK. Madeline has always had a passion for language, literacy, and linguistics. As a child, she developed an early love for codes and ciphers, and always kept a book of codes by her side. Madeline has an ongoing fascination with artistic forms of language expression. She is drawn to the beauty of symbolism, especially within Kanji, Manga, and Anime. Madeline's favorite cipher is Pig Pen. Tommy Reddicks "Education is about the process of discovery, so the trick is not always providing the answer." The father of Madeline Reddicks, Tommy Reddicks is a musician, author, and school administrator. Tommy was born in Mesa, AZ and lives in Indianapolis, IN, USA. Tommy has always had a flair for creativity, and taught music for fourteen years in public, private, and charter schools. An easy way to teach kids programming with guidance of teachers and parents. Our children carry far more immense mental abilities than we think. Just to reveal and explore them, we need to know the tools and methodologies. "I had been observing some inspiring attempts that are aiming to teach programming to children. However the thought of "I am a father and why doesn't my son learn programming?" endorsed my soul. Initially, I would think that it was early for him. But on what circumstances? We are discussing the children who catch tens of movements in the games and make decisions (I have to admit I cannot do that) in split of a second over a TabletPC in their hands. It wasn't early for him, it was late indeed. My child could have started learning programming because they had that mental capability. The missing piece in the puzzle is to introduce the appropriate tools with them. First of all, call it as programming, coding or whatever, it is one of the best application methods of mathematics. Just like application of real life. It is the life itself. Whether you like or not, math is a part of your life. Even the sentence of "Can I buy a kilogram of apple?" includes math. Programming is a way of application of math and it is one of the best ones. Because, it includes, problem solving, thinking with multi-dimensions, observing and testing results, getting excited and loving your creation, being proud once you complete; devoting for better, organizing your work, putting your best for your best... In a nutshell it includes many things among life. In other words, just like maths, programming is also an essential part of the life. While we are making a plan for a vacation, we are making a program and utilizing programming algorithms for our journey. While we are organizing a wedding event, we would be using a programming algorithm set. During studying to an exam, we are using a likely approach for programming; just like the moments of planning a meeting with a friend, driving the marketing for a product and within all the planning of a meal; and we apply those approaches to our life. The lack we don't do is to convert those approaches into programming. If we plan well, we enjoy a beautiful vacation, a happy wedding, a good get-together with a friend, we achieve highs sales with a good marketing plan, a successful exam result. That is what programming is. Programming defines how we manage our life. It is a part of our daily life. Whether we like it or not. Even if we are not making professional coding (programming), we are making programming in our professions and think like a programmer. If you are a good programmer, your program consumes less resource and you become successful in what your business. In a nutshell, programming is not an optional occurrence, in life it is the life itself. We all make programming but we create their codes differently. The biggest achievement in teaching children about how programming is done, is to enable them figure those type of life skills and background with fun and swiftness. Pushing aside all the coding techniques, contemplating over the programming and solution ways for the programming is a practice of programming and we benefit from it in every part of the life. The rest is the technicality to convert them into codes. There are so many programming languages to do that and all we have to do is to learn the syntax. Thinking all the possibilities and alternates and figuring out the most efficient is a practice of life just like in programming. I decided to channel my 30 year know-how and expertise into teaching children how to program. For that objective "Where shall we start?", "How can we make it lovable?", "What tools should we use to teach and practice the programming?" "How old should we make it start?" "What is the best methodology?" I chased the answers of questions like the ones above. While experimenting on that, my son helped me a lot. I noticed his approach and comments. I observed the other children's approach. With an honest wish to motivate and help all the children, teachers and parents... 1. Computers 2. A Brief Overview to Blockly Platform 3. The book presents comparative analyses of five elementary mathematics curriculum programs used in the U.S. from three different perspectives: the mathematical emphasis, the pedagogical approaches, and how authors communicate with teachers. These perspectives comprise a framework for examining what curriculum materials are comprised of, what is involved in reading and interpreting them, and how curriculum authors can and do support teachers in this process. Although the focus of the analysis is 5 programs used at a particular point in time, this framework extends beyond these specific programs and illuminates the complexity of curriculum materials and their role in teaching in general. Our analysis of the mathematical emphasis considers how the mathematics content is presented in each program, in terms of sequencing, the nature of mathematical tasks (cognitive demand and ongoing practice), and the way representations are used. Our analysis of the pedagogical approach examines explicit and implicit messages about how students should interact with mathematics, one another, the teacher, and the textbook around these mathematical ideas, as well as the role of the teacher. In order to examine how curriculum authors support teachers, we analyze how they communicate with teachers and what they communicate about, including the underlying mathematics, noticing student thinking, and rationale for design elements. The volume includes a chapter on curriculum design decisions based on interviews with curriculum authors.

Thinking Algebraically presents the insights of abstract algebra in a welcoming and accessible way. It succeeds in combining the advantages of rings-first and groups-first approaches while avoiding the disadvantages. After an historical overview, the first chapter studies familiar examples and elementary properties of groups and rings simultaneously to motivate the modern understanding of algebra. The text builds intuition for abstract algebra starting from high school algebra. In addition to the standard number systems, polynomials, vectors, and matrices, the first chapter introduces modular arithmetic and dihedral groups. The second chapter builds on these basic examples and properties, enabling students to learn structural ideas common to rings and groups: isomorphism, homomorphism, and direct product. The third chapter investigates introductory group theory. Later chapters delve more deeply into groups, rings, and fields, including Galois theory, and they also introduce other topics, such as lattices. The exposition is clear and conversational throughout. The book has numerous exercises in each section as well as supplemental exercises and projects for each chapter. Many examples and well over 100 figures provide support for learning. Short biographies introduce the mathematicians who proved many of the results. The book presents a pathway to algebraic thinking in a semester- or year-long algebra course.
