The most important part of a CSI's (crime scene investigator) job is accurate documentation of properly collected evidence. Documentation tells the story of the crime and can ultimately prove a suspect guilty. Through an array of specific exercises and actual document templates used in practice, Crime Scene Processing and Laboratory Workbook teaches students the proper physical evidence collection and processing techniques which will enable them to master the skills necessary to become a proficient CSI. Building on prior knowledge and facilitating hands-on experience, this laboratory manual allows students to practice the methods, procedures, and techniques associated with forensic science, crime scene investigation, documentation, and evidence handling. What makes this lab manual unique is that it follows a single hypothetical case to show each of the investigative techniques in the context of a real crime. Highlighting the skills and equipment needed for each assignment, the text presents over twenty separate exercises that alternate between investigating physical evidence specific to the crime scene and evidence specific to the laboratory. The book also provides useful forms, including the laboratory submission request, that duplicate real-world experience and demonstrate how to properly collect, record, and submit evidence. This volume is a useful companion to Gardner's Practical Crime Scene Processing and Investigation and Fisher's Techniques of Crime Scene Investigation. The exercises are designed to be completed with or without the help of a partner or as a member of a team. The appendices contain supplemental forms and numbered tent cards that can be used during the exercises along with other additional material such as a glossary and instructions on how to accurately write reports. The Criminalistics Laboratory Manual: The Basics of Forensic Investigation provides students with little to no prior knowledge of forensic science with a practical crime scene processing experience. The manual starts with an original crime scene narrative setting up the crime students are to solve. This narrative is picked up in each of the forensic science lab activities, tying each forensic discipline

together to show the integrated workings of a real crime lab. After the completion of all of the exercises, the student will be able to solve the homicide based on forensic evidence.
Forensic Anthropology Laboratory Manual CRC Press
This manual is the culmination of more than 35 years of skeletal analysis, teaching forensic anthropology and conducting skeletal research at universities and museums in the U.S., Asia, Pacific, Africa, and Europe. While there are many illustrated human osteology and anatomy books available to students and professionals, there is none that approaches the topic of identifying and siding human bones quite like The Bone Book, with its large, annotated color photographs and easy-to-follow steps. Designed for use in either the lab or the field, the book covers the material from top to bottom—from cranium to metatarsals and phalanges—with the help of more than 400 vivid, full-color photographs, clearly annotated to highlight key features. Complex bones, such as the cranium, are shown in multiple photos (including several “exploded” or disarticulated skulls, showing how the complex bones fit together). In addition to the photos, the book offers easy-to-follow instructions and mnemonic tips that guide the reader, step by step, through the process of identifying every individual bone and which side of the body it came from. The Bone Book can be used as a stand-alone reference or as a companion to other sources. Although most of the photos show adult bones, the book also includes helpful photos of subadult bones and even fetal bones, which some forensic cases involve. The Bone Book will contribute to filling a gap in identifying and siding bones more easily and, in that sense, add to the body of anthropological, anatomical, and medical literature. It will be useful to anthropology students, anatomists, surgeons, medical examiners, and others working with the human skeleton.
