In 1984, Congress simultaneously eliminated state-local regulation of cable television rates and banned telephone companies from offering cable service in their own franchise areas. Five years later, the General Accounting Office discovered that basic cable rates had risen more than four times as rapidly as the overall consumer price level since rate deregulation. As a result, Congress began to move to reimpose cable rate regulation once again, finally succeeding (over President Bush's veto) in 1992. In this book, Robert Crandall and Harold Furchtgott-Roth examine the case of reregulating cable television and find that viewers gained far more than they lost during the brief deregulatory era because cable services expanded so rapidly in the deregulated environment. Moreover, they show that new technologies, such as direct-broadcast satellites, are likely to

provide considerable market discipline for cable operators in the next few years, weakening any case for rate regulation. Given regulation's history of impeding innovation, they conclude that economic welfare is more likely to be enhanced by policies aimed at encouraging new entry into video services than by rate regulation.

Although the last two decades have seen the healthcare systems of most developed countries face pressure for major reform, the impact of this reform on the relationship between empowerment, consumerism and citizen's rights has received limited research attention. *Globalisation, Markets and Healthcare Policy* sets out to redress this imbalance. This book explores the extent to which globalisation and commercialisation relate to current and emerging health policies. It also looks at the implications for citizens, patients and social rights, as well as how policy making interacts with the interests of global and European trade and economic policies. Topics discussed include: How the impact of globalisation on health systems is apparent in the influence of international actors and European policies. How the impact of globalisation is mediated by national priorities and policies and is therefore reflected in diverse influences. How commercialisation of health is presented as benefiting citizens and patients but has the potential to undermine the aims and values inherent in health systems. How the role of citizens' interests, social rights, patient's rights and priorities of patient and public involvement need to be separated from commercialisation, choice and consumerism in

health care. Essential reading for policy makers and students of public policy, politics, law and health services, Globalisation, Markets and Healthcare Policy will also appeal to those interested in patient involvement international healthcare, international relations, trans-national organisations and the EU.

The series Advances in Industrial Control aims to report and encourage technology transfer in control engineering. The rapid development of control technology impacts all areas of the control discipline. New theory, new controllers, actuators, sensors, new industrial processes, computer methods, new applications, new philosophies, , new challenges. Much of this development work resides in industrial reports, feasibility study papers and the reports of advanced collaborative projects. The series offers an opportunity for researchers to present an extended exposition of such new work in all aspects of industrial control for wider and rapid dissemination. Within the control community there has been much discussion of and interest in the new Emerging Technologies and Methods. Neural networks along with Fuzzy Logic and Expert Systems is an emerging methodology which has the potential to contribute to the

development of intelligent control technologies. This volume of some thirteen chapters edited by Kenneth Hunt, George Irwin and Kevin Warwick makes a useful contribution to the literature of neural network methods and applications. The chapters are arranged systematically progressing from theoretical foundations, through the training aspects of neural nets and concluding with four chapters of applications. The applications include problems as diverse as oven temperature control, and energy/load forecasting routines. We hope this interesting but balanced mix of material appeals to a wide range of readers from the theoretician to the industrial applications engineer.

The challenge of communication in planetary exploration has been unusual. The guidance and control of spacecraft depend on reliable communication. Scientific data returned to earth are irreplaceable, or replaceable only at the cost of another mission. In deep space, communications propagation is good, relative to terrestrial communications, and there is an opportunity to press toward the mathematical limit of microwave communication. Yet the limits must be approached warily, with reliability as well as channel capacity in mind. Further, the effects of small changes in the earth's atmosphere and the interplanetary plasma have small but important effects on propagation time and hence on the measurement of distance. Advances are almost incredible. Communication capability measured in 18 bits per second at a given range rose by a factor of 10 in the 19 years from Explorer I of 1958 to Voyager of 1977. This improvement was attained through ingenious design based on the sort of penetrating analysis set forth in this book by engineers who took part in a highly detailed and amazingly successful program. Careful observation and analysis have told us much about limitations on the accurate measurement of distance. It is not easy to get busy people to tell others clearly and in detail how they have solved important problems. Joseph H. Yuen and the other contributors to this book are to be commended for the time and care they

have devoted to explicating one vital aspect of a great adventure of mankind.
