CARRILLO AMIYA

Essential Haematology BRILL

This Symposium is the third of a series of scientific meetings in the field of echocardiology, held at the Erasmus University Rotterdam. * The series was initiated by Klaas Born, who organized the first two meetings with great success. These followed the procedure of two days of parallel sessions with invited speakers only. This time, we decided to broaden the basis of the meeting and have a three-day program of parallel sessions, combining invited papers, free communications and posters. We decided, however, to maintain one of the most striking features of the last meeting- having the complete proceedings available at the time of the meeting. We confronted the authors-to-be with a very tight schedule in order to make the book a true reflection of the state of the art in echocardiology. As a result, editing time was also very limited and neither terminology nor units have been completely standardized. This

book has three main parts. The first, and largest, part consists of contributions on echocardiology in adults, and is divided into four sections. The first section is a general survey of various applications, whereas the remaining three centre round specific applications, i.e. ischemic disease, left ventricular function and cardiac valves, respectively. The second part contains applications in pediatric cardiology; due to the wide variety of topics covered, no particular subdivision has been made. The last part of the book is devoted to instrumentation, methods and new developments.

The reconstruction of ancient Mesopotamian medical, ritual and omen compendia and their complex history is still characterised by many difficulties, debates and gaps due to fragmentary or unpublished evidence. This book offers the first complete edition of the Assur Medical Catalogue, an 8th or 7th century BCE list of therapeutic texts, which forms a core witness for the serialisation of medical compendia in the 1st millennium BCE. The volume presents detailed analyses of this and several other related catalogues of omen series and rituals, constituting the corpora of divination and healing disciplines. The contributions discuss links between catalogues and textual sources, providing new insights into the development of compendia between serialization, standardization and diversity of local traditions. Though its a novel corpus-based approach, this volume revolutionizes the current understanding of Mesopotamian medical texts and the healing disciplines of "conjurer" and "physician". The research presented here allows one to identify core text corpora for these disciplines, as well as areas of exchange and borrowings between them.

Physiognomy and ekphrasis are two of the most important modes of description in antiquity and represent the necessary precursors of scientific description. The primary way of divining the characteristics and fate of an individual, whether inborn or acquired, was to observe the patient's external characteristics and behaviour. This volume focuses initially on two types of descriptive literature in Mesopotamia: physiognomic omens and what we might call ekphrastic description. These modalities are traced through ancient India, Ugaritic and the Hebrew Bible, before arriving at the physiognomic features of famous historical figures such as Themistocles, Socrates or Augustus in the Graeco-Roman world, where physiognomic discussions become

intertwined with typological analyses of human characters. The Arabic compendial culture absorbed and remade these different physiognomic and ekphrastic traditions, incorporating both Mesopotamian links between physiognomy and medicine and the interest in characterological 'types' that had emerged in the Hellenistic period. This volume offer the first wide-ranging picture of these modalities of description in antiquity.
