Edible insects have always been a part of human diets, but in some societies there remains a degree of disdain and disgust for their consumption. Although the majority of consumed insects are gathered in forest habitats, mass-rearing systems are being developed in many countries. Insects offer a significant opportunity to merge traditional knowledge and modern science to improve human food security worldwide. This publication describes the contribution of insects to food security and examines future prospects for raising insects at a commercial scale to improve food and feed production, diversify diets, and support livelihoods in both developing and developed countries. It shows the many traditional and potential new uses of insects for direct human consumption and the opportunities for and constraints to farming them for food and feed. It examines the body of research on issues such as insect nutrition and food safety, the use of insects as animal feed, and the processing and preservation of insects and their products. It highlights the need to develop a regulatory framework to govern the use of insects for food security. And it presents case studies and examples from around the world. Edible insects are a promising alternative to the conventional production of meat, either for direct human consumption or for indirect use as feedstock. To fully realise this potential, much work needs to be done by a wide range of stakeholders. This publication will boost awareness of the many valuable roles that insects play in sustaining nature and human life, and it will stimulate debate on the expansion of the use of

insects as food and feed.

A coloring book to familiarize the user with the Primary elements in the Periodic Table. The Periodic Table Coloring Book (PTCB) was received worldwide with acclaim. It is based on solid, proven concepts. By creating a foundation that is applicable to all science ("Oh yes, Hydrogen, I remember coloring it, part of water, it is also used as a fuel; I wonder how I could apply this to the vehicle engine I am studying...") and creating enjoyable memories associated with the elements science becomes accepted. These students will be interested in chemistry, engineering and other technical areas and will understand why those are important because they have colored those elements and what those elements do in a non-threatening environment earlier in life.

Your Periodic Table of Learning Elements Engaging, effective training programs are a mixture of science and art, requiring the right balance of adult learning theory, available technology, intuitive tools, proven practices, creativity, and risk. How does a trainer find the right combination and proportion of these elements? How does a trainer know what's possible? To answer these questions, Brian Washburn offers a simple yet elegant periodic table of learning elements modeled on the original periodic table of chemical properties. Washburn's elements—which are organized into solids, liquids, gases, radioactive, and interactive categories similar to their chemical cousins—are metaphors for the tools and strategies of the field of learning design; when they're combined, and under certain

conditions, they have the potential to create amazing learning experiences for participants. They are that impactful. From critical gas-like elements like the air we breathe, present in every training room (think instructional design or visual design), to radioactive elements, powerful and dangerous yet commonly used (think PowerPoint), Washburn guides you through the pitfalls and choices you confront in creating engaging learning experiences. A well-designed training program can be world-changing, he argues, and if you believe in your craft as a learning

professional, you can do this too. Whether you're an experienced learning designer or new to the field, this book inspires with new ideas and ways to organize the design of your learning programs. With stories from Washburn's professional experience, the book includes a hands-on glossary of definitions and descriptions for more than 50 of his elements.
