This book amalgamates the basic concepts in understanding the science of maxillofacial skeleton with the clinical skills required towards managing complex facial fractures. The book is presented in two sections. The first section introduces the readers with the

introduction to maxillofacial trauma, biomechanics of maxillofacial skeleton, the principle of internal fixation, medicolegal aspects of maxillofacial trauma, and preoperative workup which provides a brief outline towards an understanding of the basic concepts about the anatomy and physiology of facial skeleton. The second section is oriented clinically with case-based discussions that start from the emergency management of facial trauma including the recent protocols of basic life support and advanced trauma life support, emergency airway management followed by definitive management guidelines in stabilizing and fixing the fractured

facial bones. The clinical cases have been discussed in a way to provide practical knowledge and skills to the postgraduate students and clinicians who will enhance their knowledge and facilitate the decision-making process. This book aims to assist the reader in navigating the potentially complex decision-making process involved in selecting the most appropriate intervention for each particular scenario that may be encountered by the practitioner or surgeon in the growing patient with facial trauma. Among the topics covered are the initial management of both soft and bony trauma, including different types of fracture, as well as the management of complications and revision surgery. The discerning practitioner will learn how to provide the

appropriate intervention at the appropriate time, by taking into account skeletal growth when matching techniques to the injuries more common in the skeletally immature patient. It is also emphasized that in some cases, no intervention is advisable owing to the possibility of damaging growth centers or introducing additional scar tissue that may impede future growth. Pediatric Maxillofacial Trauma will provide key knowledge for surgeons treating growing patients, ensuring that their decisions to operate or delay intervention are evidence based.
