In the context of multiple crises, EU Energy and Climate policy is often identified as one of the few areas still exhibiting strong integration dynamics. However, this domain is not exempt from contestation and re-nationalization pressures. This collection seeks to understand those contradictory integration and disintegration tendencies by problematizing the notion of authority: When, why, and by whom is EU authority in Energy and Climate policy conferred and contested? What strategies are used to manage authority conflicts and to what effect? These questions are examined in some of the knottiest aspects of EU energy and climate policy, for example, the adoption of the landmark Governance of the Energy Union Regulation, the long-drawn-out attempts to complete the EU's internal energy market, the struggle to achieve ambitious EU targets in renewable energy and energy efficiency beyond 2020, the blurring of economic and security instruments in external energy policy, or the heated discussions over the Nord Stream 2 gas pipeline. The chapters in this book were originally published as a special issue of the Journal of European Integration.

Towards a Climate-Neutral Europe Cambridge University Press

This book contributes to an ongoing debate about the EU as a global actor, the organization's ability to speak with one voice in energy affairs, and the external dimension of the regulatory state. Investigating whether the Energy Union amounts to a fundamental shift towards Europe's new 'Liberal Mercantilism', it gathers high-level contributors from academia and the policy world to shed light on the changing nature of the EU's use of power in one of its most crucial policy fields. It argues that the Energy Union epitomizes a change in the EU's approach to managing its economic power. Whilst the EU remains committed to a liberal approach to international political economy, it seems ready to promote regulation for the purpose of augmenting its own power at the expense of others, notably Russia. This edited collection will appeal to political scientists, economists and energy experts. div

From Economic to Energy Transition Springer

This open access book advocates for the Social Sciences and Humanities to be more involved in energy policymaking. It forms part of the European platform for energy-related Social Sciences and Humanities' activities, and works on the premise that crossing disciplines is essential. All of its

contributions are highly interdisciplinary, with each chapter grounded in at least three different Social Sciences and Humanities disciplines. These varying perspectives come together to cover an array of issues relevant to the energy transition, including: energy poverty, justice, political ecology, governance, behaviours, imaginaries, systems approaches, modelling, as well as the particular challenges faced by interdisciplinary work. As a whole, the book presents new ideas for future energy policy, particularly at the European level. It is a valuable resource for energy researchers interested in interdisciplinary and society-relevant perspectives. Those working outside the Social Sciences and Humanities will find this book an accessible way of learning more about how these subjects can constructively contribute to energy policy.

Towards Energy Union Springer Nature

. . . this volume comes across as one of the most profound sources on the specifics of European electricity market restructuring. Competition and Regulation in Network Industries The SESSA study on the Internal Energy Market was an important and influential contribution towards the Commission's proposal for a third package of proposals, intending to bring more effective competition and better security of supply to Europe's energy markets. This volume, based on the results of the study is an important and welcome contribution to the ongoing debate on these proposals. Andris Piebalgs, Commissioner for Energy at the European Commission The chapters in this book are written by the leading European scholars who have studied the structure, behavior and performance of liberalised electricity markets in many European countries as well as in other regions of the world. Both the analyses and the policy recommendations contained in this volume are well worth careful consideration by policymakers in Europe, as well as by policymakers in other countries that are seeking to adopt successful electricity sector liberalisation programs. From the foreword by Paul L. Joskow, Massachusetts Institute of Technology, US Dynamism or dissipation? Competition or national champions? Will enlargement promote or delay reform? Energy economists contemplate the challenges posed by the restless and discontent European Commission. Stephen Littlechild, University of Birmingham and Judge Institute for Management Studies, University of Cambridge, UK The challenge of European electricity reform is being met, although gradually, delays notwithstanding. This book provides precious help in spotting where the necessary further efforts should be directed. In the US mistakes and delays have occurred, no less than in Europe, but an aggressive federal regulator (absent in Europe) is working to overcome them. Electricity markets do not happen, they have to be built. Here are suggestions for a workable European market design. No ideology, just competence and wisdom from both theory and experience. Will Europe learn? Pippo

Ranci, Università Cattolica del Sacro Cuore, Italy The realisation of a European internal market for energy is still a work in progress. Written by leading European scholars and discussed with major energy stakeholders, this book presents a thorough analysis of the motives and methods needed to achieve a single European energy market. The authors discuss the critical issues surrounding an internal European energy market including: market design, competition and market power, sustainable energy versus the market, regulation and harmonisation, benchmarking and indicators, modelling of competition, market prices and energy forecasts. They provide a multi-disciplinary assessment of the best way to build the market base of a future European energy policy. Electricity Reform in Europe will be of great interest to decision makers and managers in the energy industry or business sector as they will be able to see the whole European energy policy picture beyond their own corporate interests. The book will also appeal to national and European energy administrations, regulatory bodies and policy makers providing a synthesis of all relevant policy issues.

European Energy Studies, Volume 8 Claeys & Casteels Law Publishing

Since the mid-2000s, the European Union has made unprecedented strides toward the creation of a common energy policy. This book takes stock of these developments, evaluating how much progress has actually been made and what remains to be done, what factors explain these recent advances and their limitations.

Introduction Edward Elgar Publishing

This timely book shows how the creation of a European Energy Union might be an effective and viable solution to the energy security problems that the European Union (EU) is facing. The aim is to make it easier to trade energy inside the EU. The EU currently has to rely on energy-rich countries for its energy needs, many of whom are politically and economically unstable. This places the EU in a vulnerable position. The book explores the institutional and legal framework for the creation of a European Energy Union, whose aim is to achieve affordable, secure and sustainable energy. This Energy Union is based on five pillars, which are analyzed: security, solidarity and trust; the completion of a competitive internal market; moderation of demand; the decarbonization of the EU energy mix (i.e., greater use of renewable energy); and technologies. The book explores what the EU is politically prepared to accept as part of its unified energy security. Combined with the perception of energy security being a pressing matter, the general disenchantment surrounding the European ideal in the wake of the economic crisis makes the task of ensuring affordable, secure and sustainable energy a formidable challenge. In that vein, the European Energy Union could well be the flagship of this new outset towards a more prosperous, energy-secure and unified Europe, bearing in mind that EU Member States wish to guard their sovereignty over national energy systems. In the past, there have been divisions between EU Member States when trying to draft a unified energy policy. The European Energy Union tries to rectify this deficiency. This book proposes the emulation of the EU's common commercial policy to reach a common position in EU energy policy. It analyzes the role of the Energy Community and the Euro-Mediterranean Energy Partnership, the Transatlantic Trade and Investment Partnership, the Caspian region, the Southern Gas Corridor and a few Russian gas pipeline projects as avenues to further integrate energy markets beyond European borders. It also dwells on the advancements that could arise in terms of pan-European energy infrastructure through the anticipated financial boost resulting from, inter alia, the

Investment Plan for Europe, the European Structural and Investment funds, and the Connecting Europe Facility. Finally, it provides an analysis of climate change mitigation by focusing on the importance of decarbonizing the economy and analyzing the 2015 Paris Agreement on Climate Change.

Advancing Energy Policy The Stationery Office

The world is currently undergoing an historic energy transition, driven by increasingly stringent decarbonisation policies and rapid advances in low-carbon technologies. The large-scale shift to low-carbon energy is disrupting the global energy system, impacting whole economies, and changing the political dynamics within and between countries. This open access book, written by leading energy scholars, examines the economic and geopolitical implications of the global energy transition, from both regional and thematic perspectives. The first part of the book addresses the geopolitical implications in the world's main energy-producing and energy-consuming regions, while the second presents in-depth case studies on selected issues, ranging from the geopolitics of renewable energy, to the mineral foundations of the global energy transformation, to governance issues in connection with the changing global energy order. Given its scope, the book will appeal to researchers in energy, climate change and international relations, as well as to professionals working in the energy industry.

Energy Security Strategy Springer

On 27 October 2015, the Nordic Council of Ministers for Business, Energy and Regional Policy (MR-NER) decided to carry out a strategic review of Nordic co-operation on energy and how it could be developed over the next 5-10 years. The strategic review is part of the Nordic Council of Ministers' reform project initiated by its Secretary General, Dagfinn Høybråten. Strategic reviews have previously been conducted on foreign and security policy, health and labour-market co-operation. The remit was to present 10-15 concrete proposals that would further enhance co-operation in areas in which significant positive outcomes have been achieved over the past two decades. The Paris Climate Change Conference of December 2015 and the EU's goal of working towards a European Energy Union make this review particularly timely. It is also based on the Nordic countries' own reviews of their national climate and energy policies. The geopolitical landscape is currently in a state of flux - global trade and climate policies are under pressure, and nationalist tendencies are emerging in many countries. This presents many challenges to Nordic energy co-operation, which has achieved ground-breaking results based on cross-border co-operation. Various studies have also shown that the Nordic Region has made similarly dramatic gains in terms of welfare. The time has come to assess how the Nordic countries can build on this success, despite adverse international trends. This review seeks to identify these challenges, present proposals for how the Nordic countries can move forward, and inspire further discussion and debate. EU Energy Law, Volume 11 Claeys & Casteels

Energy security is one of the main problems that humanity faces today and the European Union (EU) has to rely on energy-rich countries for its energy needs. The European Innovation Union, the Energy Community, and the Europe 2020 initiative address energy security as a priority, but policies seem to be reactive instead of addressing energy security in its complexity. This problem can be solved with appropriate legal tools. Energy governance has links with several policies: trade, investment, environmental protection, energy transit, energy security, finance, et cetera. Of these policies, energy trade has a high impact for European energy security policy. Currently, the international community does not address trade in energy as a cohesive entity and its governance is fragmented. The paper explores the institutional legal framework for the creation of a European energy union, whose aim is to achieve affordable, secure and sustainable energy. This energy union is based on five pillars, which are analyzed: security, solidarity and trust; the completion of a competitive internal market; moderation of demand; the decarbonization of the EU energy mix (i.e., greater use of renewable energy); and technologies. The EU is the first region in the world to set up the

ambitious target of decarbonizing its economy by 2050. The paper then looks at the energy union in the context of the rule of law. All of this could be reproduced in other regions of the world and eventually create a new international energy order. This requires a fresh and comprehensive approach to legal instruments.

Energy Policy Making in the EU Academic Press

Energy Policy in the European Union analyses the development of energy policy in the EU focusing in particular on the key period between 1985 and 1995 and the role of the major states - Germany, France, Italy, and Britain - and their interaction with the Commission. The role of interest groups as well as other EU actors is also covered in-depth as well as the European Energy Charter, EU policy towards the East, and the relationship between energy and the environment.

The European Dimension of Germany's Energy Transition Springer Nature

The EU's gas market is at the very centre of the Energy Union, and is changing faster than ever before. Indeed, the European Council has stressed repeatedly the EU's priority of ensuring its gas security, and promoting liquid and competitive gas markets across the whole of the EU. The Commission has already proposed a revision to the gas Security of Supply Regulation and negotiations are close to finalization. Earlier this year, the Commission published an 'LNG Strategy'. In terms of market integration, the progressive adoption of grid codes is further integrating markets, and the emergence of active trading hubs in North West Europe, is seeing the emergence of similar liquid markets throughout the EU. The EU has also been actively pursuing its aim of diversifying its sources of gas supplies, making progress in bringing the Southern Corridor to fruition, and is actively looking at other potential suppliers, for example in the Eastern Mediterranean. And in the competition policy the Commission has equally been active, scrutinising the behaviour in particular of companies holding dominant positions in parts of the EU. This volume, introduced by EU Energy Commissioner Miguel Arias CANETE, brings together commentary and analysis by some of the leading Commission officials, lawyers and industry gurus on all of these issues, covering a comprehensive overview of the challenges faced by the EU, its response, and the future direction of EU gas policy. Towards a European Energy Union Springer

The book adopts an innovative analytical approach to agenda setting by not only presenting successful cases in which energy issues were addressed by means of public policy, but by also analyzing failed attempts to make issues part of the European policy agenda. Another outstanding feature of the book is its use of the latest empirical data on a broad range of energy issues. When are energy issues likely to find their way to the agenda of European policymakers? This is the key research question guiding this collection of empirical studies, which will shed light on both successful and unsuccessful attempts to include energy issues in the European agenda. The multi-level political system of the European Union represents a particularly fruitful setting for addressing this question due to the multiple institutional access points it provides for different groups of actors. The book has three key benefits. First, it provides a theory-informed analysis of agenda setting processes in general and in the European Union in particular. Second, it presents an overview of the most important and emerging dimensions on European energy policy, and third, it helps to develop a research agenda for future research in the field.

Towards a European Energy Policy Claeys & Casteels Law Publishing

This authoritative Research Handbook presents, for the first time, a comprehensive overview of the most important research and latest trends in EU energy law and policy. It offers high-quality original contributions that provide state-of-the-art research in this rapidly evolving area, situated in the broader context of international economic law and governance.

The Geopolitics of the Global Energy Transition Routledge

The European Energy Union will ensure that Europe has secure, affordable and climate-friendly energy. Wiser energy use helps the fight against climate change and is both a spur for new jobs and growth and an investment in Europe's future.

The European Energy Union Oxford University Press, USA

This book addresses the interactions between Germany's energy transition and the EU's energy policy framework. It seeks to analyze the manifold connections between the prospects of the proclaimed "Energy Union" and the future of Germany's energy transition, and identifies relevant lessons for the transformation at the EU level that can be learned from the case of Germany, as a first-mover of transforming energy systems towards renewables. The various repercussions (political, economic and systemic) from the national transition are explored within the EU context as it responds to the German transition, taking into account both existing frictions and potential synergies between predominantly national sustainability policies and the EU's push towards harmonized policies within a common market. The book's overall aim is to identify the most critical issues, in order to avoid pitfalls and capitalize on opportunities.

The European Union's Single Market. Integration towards the European Energy Union Edward Elgar Publishing

This Handbook provides the most comprehensive account of energy governance in Europe, examining both energy governance at the European level and the development of energy policy in 30 European countries. Authored by leading scholars, the first part of the book offers a broad overview of the topics of energy research, including theories of energy transitions, strategies and norms of energy policy, governance instruments in the field, and challenges of energy governance. In the second part, it examines the internal and external dimensions of energy governance in the European Union. The third part presents in-depth country studies, which investigate national trajectories of energy policy, including an analysis of the policy instruments and coordination mechanisms for energy transitions. It closes with a comparative analysis of national energy governance. This book is a definitive resource for scholars in energy and climate research as well as decision makers in national governments and EU institutions.

The Role of Gas in the EU's Energy Union Routledge

The European Union is poised to establish a genuine European Energy Union with the new powers conferred on it by the Lisbon Treaty. Since 2014, it has been developing and implementing an energy strategy that responds to the three overarching priorities of climate change, political security, and economic competitiveness by 2030. The European Energy Union aims to provide secure, sustainable and affordable energy throughout the cycle of production, transport and consumption. This book outlines the legal regime underpinning this regulatory strategy, which integrates EU law with international law and with the law of the member states and affiliated states.

It analyses and explains the increasing interaction between these legal orders in achieving the shared objective of transforming the European and global energy systems. This book will appeal to scholars and students of energy law and Policy at both European and international levels.

The Creation of a European Energy Union Palgrave Macmillan

This book will explore how far the European Union can go towards forming its 28 member states into an Energy Union. It analyses how the EU can achieve its goal of providing energy affordability, security, and sustainability in the light of internal dynamics in European energy markets, and of the urgency in mitigating climate change. It also considers the increasingly unfavourable external context for the cost and security aspects of Europe's go-it-alone decarbonization effort created by oil price volatility and geo-political tensions with Russia. Chapter 1 provides an overview of past energy and climate decisions in order to situate current EU policy and successive chapters tackle the new energy challenges. The volume covers the growing tension between Brussels' campaign to liberalise and integrate energy markets through cross-border competition and trade, and increasing state intervention through national renewable subsidies that fragment the market. It also analyses the revolution in electricity markets and investment incentives turned upside down by renewable subsidies, and proposes a new market design to guide Europe through this uncharted territory. The book examines the need for flexible demand response from energy consumers as a match to increasingly inflexible energy supply from weather-dependent renewables. It also looks at the EU's 2030 targets and proposed emission trading and renewable energy reforms, and assesses how they measure up to the climate commitments of other countries as well as to the EU's long term climate aims. Underscoring the EU's inability to exist in its own energy bubble, two chapters analyse whether European industry can stay competitive with the rest of the world and how Europe is diversifying its energy sources away from Russia. The conclusion examines what a genuine energy union might mean in terms of EU governance of national energy policies, and how far short the EU will fall short of this.

From the European Energy Community to the Energy Union Edward Elgar Publishing

This book explains the EU's climate policies in an accessible way, to demonstrate the step-by-step approach that has been used to develop these policies, and the ways in which they have been tested and further improved in the light of experience. The latest changes to the legislation are fully explained throughout. The chapters throughout this volume show that no single policy instrument can bring down greenhouse gas emissions. The challenge facing the EU, as for many countries that have made pledges under the Paris Agreement, is to put together a toolbox of policy instruments that is coherent, delivers emissions reductions, and is cost-effective. The book stands out by the fact

it covers the EU's emissions trading system, the energy sector and other economic sectors, including their development in the context of international climate policy. This accessible book will be of great relevance to students, scholars and policy makers alike. The Open Access version of this
