This book constitutes the thoroughly refereed post-conference proceedings of the International IFIP WG 5.7 Conference on Advances in Production Management Systems, APMS 2011, held in Stavanger, Norway, in September 2011. The 66 revised and extended full papers were carefully reviewed and selected from 124 papers presented at the conference. The papers are organized in 3 parts: production process, supply chain management, and strategy. They represent the breadth and complexity of topics in operations management, ranging from optimization and use of technology, management of organizations and networks, to sustainable production and globalization. The authors use a broad range of methodological

approaches spanning from grounded theory and qualitative methods, via a broad set of statistical methods to modeling and simulation techniques.

This book examines the fundamental mathematical and stochastic process techniques needed to study the behavior of extreme values of phenomena based on independent and identically distributed random variables and vectors. It emphasizes the core primacy of three topics necessary for understanding extremes: the analytical theory of regularly varying functions; the probabilistic theory of point processes and random measures; and the link to asymptotic distribution approximations provided by the theory of weak convergence of probability measures in metric spaces.

Practical and evidence-based, this unique book is the first comprehensive text focused on person-centered approaches to people with serious mental illness such as schizophrenia and bipolar disorder. It reflects a range of views and findings regarding assessment, treatment, rehabilitation, self-help, policy-making, education and research. It is highly recommended for all healthcare professionals, students, researchers and educators involved in general practice, psychiatry, nursing, social work, clinical psychology and therapy. Healthcare service providers, and policy makers and shapers, will find the book's wide-ranging, multi-professional approach enlightening. 'Serious Mental Illness

reflects a continued distancing from the outmoded and unsubstantiated belief that people with severe mental illnesses could not recover, and that they would respond positively only to goals and treatment plans chosen, designed and implemented by providers in order to prevent their further deterioration. Anyone with an interest in the concept of person-centered approaches will discover new ideas in this book. Indeed, anyone with an interest in person-centered approaches has to read this book. Not only is it the first such book on person-centered approaches, but it will serve as the gold standard in this topic area for years to come.' William A Anthony, in the Foreword

This book contains the proceedings of the first International Workshop on Interval/Probabilistic Uncertainty and Non Classical Logics, Ishikawa, Japan, March 25-28, 2008. The workshop brought together researchers working on interval and probabilistic uncertainty and on non-classical logics. It is hoped this workshop will lead to a boost in the much-needed collaboration between the uncertainty analysis and non-classical logic communities, and thus, to better processing of uncertainty.

Excerpt from *Maintaining Historic Buildings: An Annotated Bibliography* In the preservation of historic buildings, the most critical area, and the most overlooked, is that of maintenance. All too often, it is based on short term economic decisions rather than long-term preservation goals, and deferred until the building deteriorates to such a point that a costly repair project must be undertaken to recover its historic appearance. The rewards of maintenance may seem too subtle to notice at first; in fact, small, repeated work tasks may even appear to be unproductive because there is no immediately visible evidence of their benefit. Often, it is only when major repairs or restoration are required that the true value of regular, scheduled maintenance is seen. The aim of preservation is to manage the inevitable deterioration of a building. Maintenance is the almost constant application of preservation treatments to reduce wear and deterioration and prolong the life of a building. A good maintenance plan, based on the preservation goals for the building and its use, is the key to successful preservation. Maintenance without a plan can be just as destructive as no maintenance at all, with each patch and repair destroying a bit more of the original fabric until integrity is

lost. Or it may have the opposite effect, improving on the original design, which may have been built with defects, or eliminating all signs of normal wear and weathering. The result is a well maintained building looking nothing like it would have historically. The components of a good maintenance plan are: the inspection system, work schedules, building records, report systems, and reference support materials. An effective plan should also include a means of evaluating maintenance activities to find strengths and weaknesses (and adjusting the plan as needed) and a system of cost accounting, as well as a training program for any personnel involved in the maintenance of the building. The building inspection is the basis of a good maintenance plan. Full inspections should be performed annually and are used to identify maintenance tasks and pinpoint areas of concern that require further monitoring. Other inspections should be done on a regular basis. Still other inspections should be done on an as-needed basis; for example, the roof should be examined during a heavy rain and after severe storms; collections should be checked for insects and other damage monthly; and a casual inspection should be included in every housekeeping routine. This book considers the problem of providing maximum access to transport services, and to roads for the rural population of the world's developing countries when limited funds are available. Access is a key factor in both social and economic development. It promotes social intercourse and opens up markets for both the rural and urban populations. Access connotes the ability to travel and to transport goods. The components of access include both the infrastructure and the transport modes or aids that use the infrastructure.
