The purpose of this study was to evaluate the effectiveness of two different eighth-grade algebra support programs. Algebra Topics is a year-long elective math course in which students enroll in addition to their eighth grade algebra course. The Algebra Academy is a second semester support program, serving recommended students with low first semester Algebra 1 grades. We hypothesized that both the Algebra Topics course and Algebra Academy would improve the performance of eighth grade students simultaneously enrolled in Algebra I. The effect of the Algebra Topics course on the 20 students enrolled was assessed by reviewing their first semester grades and SAT -9 scores. These scores were compared to the grades and test scores of 21 students who did not enroll in Algebra Topics. The second semester grades and SAT -9 scores of the 9 students enrolled in the Algebra Academy were also compared to the grades and test scores of the 9 students not enrolled. Both teachers administrating the two support programs were also interviewed. The findings suggest that students enrolled in the Algebra Topics performed better on semester grades and SAT -9 tests than students not enrolled. The data revealed that students enrolled in Algebra Academy had lower semester grades and comparable SAT -9 scores. Although both programs offered a

"double dose" of Algebra, the two programs differed in accountability, time, structure, and student perception. Recommendations for eighth grade algebra support programs are included.

This is the second in a series of three volumes dealing with important topics in algebra. Volume 2 is an introduction to linear algebra (including linear algebra over rings), Galois theory, representation theory, and the theory of group extensions. The section on linear algebra (chapters 1-5) does not require any background material from Algebra 1, except an understanding of set theory. Linear algebra is the most applicable branch of mathematics, and it is essential for students of science and engineering. As such, the text can be used for one-semester courses for these students. The remaining part of the volume discusses Jordan and rational forms, general linear algebra (linear algebra over group algebras), Galois theory, representation theory (linear algebra over group algebras), and the theory of extension of groups follow linear algebra, and is suitable as a text for the second and third year students specializing in mathematics.
