This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation. Consequences of diseases, e.g. impairments and activity limitations, are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation bridging the gap between clinical

evidence and clinical decision-making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors, as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic, but concise review of the evidence (RCTs, systematic reviews and meta-analyses) that is relevant for clinical decision-making, and comments on assessment, therapy (training, technology, medication), and the use of

technical aids as appropriate. Based on these summaries, clinical algorithms / pathways are provided and the main clinical-decision situations are portrayed. The book is invaluable for all neurorehabilitation team members, clinicians, nurses, and therapists in neurology, physical medicine and rehabilitation, and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative, bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision-making for individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives.

The clinical problems and dilemmas which the busy clinician encounters on a daily basis are the main focus of this publication. Emphasizing a clinical rather than a pathophysiological approach to problems, it facilitates access and helps the practicing clinician to develop an effective and efficient diagnostic and therapeutic strategy. Nevertheless, clinically important aspects of pathophysiology are also dealt with in detail when called for. A variety of scenarios that are especially relevant to modern medical practice, such as the intensive care unit, are taken into account. A group of internationally renowned experts guides the reader through the broad variety of diagnostic options available to assist in the

assessment of symptoms originating anywhere along the gastrointestinal tract, from the esophagus to the anus, and, in each instance, every effort is made to critically appraise the technology discussed. Moreover, general overviews of broadly relevant therapeutic approaches are also provided.

"Post-stroke dysphagia (PSD) occurs in 37-78% of acute stroke patients and is associated with increased morbidity and mortality. PSD is often under-recognized and under-treated in acute care settings despite the Best Practice Guidelines suggesting dysphagia screening for

acute stroke patients prior to receiving food, fluids, or oral medications as well as reevaluation by a Speech Language Therapist (SLT) within 72 hours of admission in patients who screen positive for dysphagia risk on an initial assessment. Intervention for PSD patients can improve clinical outcomes; however, several recent studies have demonstrated a deficiency in clinical adherence to the guidelines. This study was a retrospective medical record review of 94 acute stroke patients to determine whether the guidelines surrounding dysphagia screening and management were being adhered to in one acute care hospital in mid-Michigan between October 1, 2020 and December 31, 2020. Analysis of the electronic health record (EHR) revealed that 86.2%

of participants were screened for dysphagia, with 80.9% of screens having been conducted prior to oral administration of food, fluids, or medications. One hundred percent (100%) of patients who failed initial dysphagia screening were reevaluated by a SLT within 72 hours. Common interventions prescribed for PSD patients were enteral feeding, NPO status, hydration or nutrition supplementation, diet modification, feeding safety techniques, oral care, and oral rehabilitation. The study indicated that this acute care hospital has similar findings as prior research that has been conducted but excelled in referral to a SLT and the endorsement of evidence-based interventions. This study yields an opportunity for further research to be

undertaken and has implications for clinical guidelines and protocols to be developed." -- From page iv.

Background: Emerging research emphasises the significant impact that dysphagia has on the psychosocial health and well-being of persons following stroke. Presently, there is limited information regarding current clinical practice in this area. This study aims to determine the current practices of Speech and Language Therapists (SLTs) internationally when addressing quality of life issues in dysphagia following stroke. Methods: An anonymous cross-sectional, non-experimental survey study was used, consisting of 18 open and closed questions exploring participant's beliefs, opinions and current clinical practice when managing quality of life issues in dysphagia

following stroke. The survey was created and disseminated through international professional bodies and academic institutions, using surveymonkey.com. Results: 223 SLTs responded to the survey, of which 143 currently work with persons with dysphagia following stroke. Respondents report lacking confidence and knowledge when working in this clinical area. Facilitators and barriers to good quality care are identified. Comparisons are made between current practice patterns and known patient care priorities as reported in research to date. Conclusions: A disparity exists between current clinical practice and patient care priorities when addressing quality of life issues in dysphagia following stroke. Further research and

the development of best practice guidelines may contribute to bridging this gap.

This is the first book to concentrate on dysphagia in rare conditions □ those that occur infrequently or those that may occur more frequently but are only sometimes associated with dysphagia. Covering a wide range of conditions □ from progressive supranuclear palsy (PSP), through connective tissue disease, to conditions as diverse as West Nile virus □ the editors and expert contributors efficiently synthesize the available information to provide the essentials needed to help clinicians to perform sophisticated assessments,

based on their knowledge of both the conditions and the expected swallowing signs and treatments. Each entry covers the neurology of the given condition, including the signs and symptoms, neuropathology, epidemiology and genetics. Thereafter, coverage of swallowing in each condition examines the diagnostic signs and symptoms, etiology, swallowing neuropathology, associated cognitive, linguistic, and communicative signs and symptoms, special diagnostic considerations, treatment, nutrition, hydration, and medications.

"There is an apocryphal story of an eminent neurology professor who was asked to provide a differential diagnosis. He allegedly quipped: "I can't give you a differential diagnosis. If you wish I will give you a list of wrong diagnoses followed by the right diagnosis." Sadly, this sort of arrogance pervaded our field, particularly in the era before there were accurate diagnostic methods and effective treatments of neurological diseases. Fortunately, this sort of

pomposity is now relegated to the past and remains only as an antique reminder of a type of hubris that precluded discovery and progress in diseases of the nervous system"--

Collaborative capacity development to complement stroke rehabilitation in Africa Springer Nature

Stroke is the most common neurologic disease and the leading cause of adult disability in Western countries. The initial diagnosis of stroke is clinical and needs to be done as rapidly as possible to guarantee optimal medical and interventional therapy. The emergency stroke management depends heavily upon stroke scores to quantify the damage and to speed up the diagnosis process. Unfortunately, several important stroke syndromes are not

taken into consideration in these currently used stroke scores and therefore tend to be overlooked and not treated. Compiled by leading international experts, this book provides an excellent overview on current stroke syndromes, including particularly problematic clinical pictures. Thus, together with stroke scores, the publication will lead to more thorough assessments in emergency settings. This book is indispensable for neurologists, neurosurgeons, neuroradiologists and physicians involved in the care of stroke patients.

Currently, there are very few resources that provide guidance for practicing clinicians in the area of neuromuscular diseases. *Dysphagia in Neuromuscular Diseases* approaches the subject in a unique manner, allowing clinicians to develop insights into diseases, syndromes, and neurological conditions that extend even beyond those specifically addressed in the text. Compared to competitive texts, this book uniquely provides in-depth coverage specific to dysphagia research with a much broader spectrum of neuromuscular diseases, and employs a

physiologically based taxonomy. Recognizing there is no universally accepted methodology for classification of neuromuscular diseases, the authors have addressed this dilemma in three ways: (1) outlining the levels of the neuromuscular system, extending from the central nervous system to the muscle, with chapters devoted to diseases that are representative of pathologies at each level; (2) outlining normal respiratory physiology and airway defense mechanisms, with discussion of how these are altered by various neuromuscular disease processes and how this affects risk for secondary medical complications such as pneumonia; and (3) describing the neuromuscular conditions that are associated with the various diseases

with discussion of approaches to evaluation, management and treatment that address the nature of the impairment. With over 50 years of combined clinical practice and extensive experience in working with patients diagnosed with various neuromuscular diseases, the authors offer practitioners the best available evidence to support treatment decisions.

The Yale Swallow Protocol is an evidence-based protocol that is the only screening instrument that both identifies aspiration risk and, when passed, is able to recommend specific oral diets without the need for further instrumental dysphagia testing. Based upon research by Drs. Steven B. Leder and Debra M. Suiter, an easily administered, reliable and validated swallow screening protocol was developed and can be used by speech-language pathologists, nurses,

otolaryngologists, oncologists, neurologists, intensivists and physicians assistants. In addition, the protocol can be used in a variety of environments, including acute care, rehabilitation and nursing homes. The Yale Swallow Protocol meets all of the criteria necessary for a successful screening test, including being simple to administer, cross-disciplinary, cost effective, acceptable to patients and able to identify the target attribute by giving a positive finding when aspiration risk is present and a negative finding when aspiration risk is absent. Additionally, early and accurate identification of aspiration risk can significantly reduce health-care costs associated with recognized prandial aspiration.
