Landmark book written at Oak Ridge National Laboratory under the auspices of the Atomic Energy Commission as part of its Atoms for Peace program. FLUID FUEL REACTORS approaches to

the subject of nuclear power from a chemical standpoint, rather than from the point of view of mechanical engineering. Today, the value of this approach has (finally) been recognized by venture capitalists such as Peter Thiel, philanthropists such as Bill Gates, and policy makers in Washington who have recently been passing advanced-reactor friendly legislation year after year. China's Navy is funding the Chinese Academy of Science Thorium Molten Salt Reactor program. The DoE (through GAIN) has funded essential Molten Salt research in the United States. Canada has funded Molten Salt research, and is currently conducting a pre-licensing vendor review. Dr. Anil Kokodkar, the former-head of India's nuclear program has stated, given a do-over he'd have pursued a liquid fuel (as opposed to a conventional solid fuel) approach to advanced nuclear. Molten Salt Reactor startups are flourishing, and typically, a single copy of FLUID FUEL REACTORS can be found in their head-office. The founders of these startups are driven to provide clean energy to developing nations, and replace today's polluting energy options which power western industry and prosperity. First printed in 1958, FLUID FUEL REACTORS continues to be cited as a useful reference by ORNL engineers, MSR startup employees, and those in academia. Alvin Weinberg suggested people should re-examine "dusty old books" such as FLUID FUEL REACTORS in his last recorded public interview (2 years before his death) at the University of Tennessee on 2004. Used physical copies have sold online for well over $1,000. 60 years after FLUID FUEL REACTORS was first published, it can now, for the first time, be enjoyed on digital reading devices, in a manner that supports adjustable font sizes and easy-to-read formatting... as opposed to looking at a series of bitmap images of words, like an animal.

This textbook is for a first course on electronics. It assumes no prior electronics experience, but does assume that students have had calculus 1 (single-variable differential calculus) and high-school physics.A key idea of the course is that students need a lot of design experience and hands-on work, rather than a lot of theory. The course is centered around

the labs, which are a mix of design labs and measurement/modeling labs.This unique volume takes students from knowing no electronics to being able to design and build amplifier and filter circuits for connecting sensors to microcontrollers within 20 weeks. Students design a digital thermometer, a blood-pressure meter, an optical pulse monitor, an EKG, an audio preamplifier, and a class-D power amplifier. They also learn how to measure and characterize components, including impedance spectroscopy of a loudspeaker and of electrochemical electrodes.Related Link(s)
