La conoscenza dei meccanismi biologici e dei meccanismi patologici del sistema immunitario necessaria per diagnosticare allergie, immunodeficienze nonché malattie autoimmuni e autoinfiammatorie può essere raggiunta solo partendo da solide basi di immunologia cellulare e molecolare. L'immunologia, negli ultimi vent'anni, ha vissuto una vera e propria

rivoluzione determinata dal continuo aggiornamento o delle conoscenze di base mutuata dalla biologia molecolare e della fisiologia. L'Abbas è l'indiscusso riferimento internazionale su questa materia e la decima edizione include le più recenti acquisizioni su un grande numero di argomenti: i macrofagi residenti nei tessuti, le cellule T della memoria, i meccanismi tramite cui

l'inflammasom a stimola la risposta immunitaria, quello delle risposte immunitarie T-mediate e quello per evitare l'elusione del sistema immunitario da parte delle cellule tumorali. Nel percorso di formazione lo studente si troverà di fronte a quesiti affascinanti: "Perché i pazienti con la celiachia a volte hanno anche il diabete? In cosa consiste la terapia con anticorpi

monoclonali? Perché i bambini che crescono a contatto con gli animali domestici hanno minori probabilità di sviluppare infezioni respiratorie?". L'Abbas consente di rispondere a queste e a molte altre domande con una solida conoscenza dei processi e dei meccanismi che regolano la perfetta orchestra del nostro sistema immunitario. Saunders Company L'immunologia è una disciplina in continua evoluzione, tanto che oggi i suoi principi fondamentali costituiscono le basi per lo sviluppo razionale di nuove terapie immunologiche. Anche in questa nona edizione Immunologia cellulare e

molecolare mantiene l'impostazione pratica e le caratteristiche di chiarezza, completezza e precisione che ne hanno fatto il libro più venduto tra gli studenti di medicina. Oltre ad affrontare gli elementi fondamentali della immunologia in modo più intuitivo, gli autori si sono focalizzati soprattutto sulla rilevanza clinica dell'immunologia. I concetti principali sono evidenziati all'interno di ampliati box

discorsivi e tabelle riassuntive, per permettere ai lettori di accedere rapidamente alle informazioni più complesse. Anche le illustrazioni sono protagoniste di questa nuova edizione, visto lo sforzo innovativo che le rende visibilmente più esplicative. L'aggiornamento dei contenuti della nona edizione riguarda in particolare: -

<p>l'immunità dei tumori (antigeni tumorali, immunoterapia del cancro); - i controlli immunitari; - i sensori citosolici per DNA; - infiammazioni non canonici; - prionizzazione come meccanismo di segnalazione; - i difetti monogenici dell'immunità. <u>Cellular and Molecular Immunology</u> Elsevier España Basic Immunology: Functions and Disorders of the Immune System, 6e: SAE-E-book</p>	<p><u>Role of Neutrophils in Disease Pathogenesis</u> Elsevier srl Nueva edición del "baby Abbas" que cubre la asignatura de Inmunología de una forma concisa, visual y presentando la información justa para el estudiante de Medicina o de Farmacia, Biotecnología o Ciencias Biomédicas que se enfrenta por primera vez a la asignatura. Elsevier Health Sciences This book contains the proceedings of the Serono Symposia USA international symposium on Genetic Models of Immune and Inflammatory Dis eases held on October 20 to 23, 1994, in Savannah, Georgia. The advent of methods for introducing genes into the germlines of mice, and for targeted disruption of particular genes by homologous recombination</p>

, has provided scientists in many disciplines with an extraordinarily powerful set of analytical tools. Some of the most informative applications of transgenic and gene knockout technology have been in studies of lymphocyte development and activation. The goal of this symposium was to bring together investigators using these genetic approaches for analyzing the immune

system, with a view to defining common themes and novel directions. Transgenic mice have a wide variety of important applications in immunology. Defined proteins can be expressed in selected tissues throughout development, thus acquiring the essential characteristic of "self" antigens. Such models have been used to study how immune responses to these artificially

created "self" antigens are controlled. Antigen receptors of lymphocytes have been expressed as transgenes, and because lymphocytes are endowed with the unique property of allelic exclusion, such transgenic mice become essentially monospecific. Immunomodulatory agents have been expressed in defined tissues or throughout the body, providing tools for studying

the functional consequences of dysregulated expression of biological response modifiers.
