This brief Blaster's Guide will provide methods to quickly create general blast designs by: estimating burden, spacing, stemming and subdrilling as well as explosive loads. Charts are available to help explain blast vibration and air overpressure. The new charts provide

comparisons of blast vibration and normal environmental vibration as well as air overpressure compared to wind. These charts provide both the laymen and professional with an easy, understandable method to compare blast effects with normal activities and normal environmental phenomena. The first section of the guide will provide a series of tables that, with little effort, can be used to determine average blast design dimensions. Additional forms are also given for blasting plans, seismic monitoring reports and blasting logs etc. This guide will enable the blaster to estimate dimensions in the field as well as provide the necessary forms for control of

blasting operations.

This book provides a guide to the use and

meaning of toxicological and ecological information in the paper industry. For example, the information provided by suppliers of paper chemicals to paper mills is analysed in detail. This allows for greater understanding by users and therefore awareness of the possible implications of handling a given chemical with respect to its impact on the working environment, the final product and the environment beyond the mill. The information currently available is collected, summarised and systematised so that users bombarded with

inconsistent Safety Data Sheets can make intelligent use of them or can ask sensible questions of their suppliers. Emphasis is on providing guidance on how to find a commercially realistic path between over evaluation and under evaluation of potential health and environmental risks.
